[511] Individual commenter, FTC–2023–0007–4989.

became progressively worse and since I've left, I've stopped taking my medication.[512]

- I am a commissioned employee in the mortgage world, and I had a non-compete with my former company in Ohio. Near the end of my time at this company, they merged with another company and put the new company in charge of the sales staff. It was miserable. We started having issues, even with having basic supplies, and it went from just harming me to harming my ability to get business complete, which harms the consumer. I left and I was sued for a three year period. . . . I really do not feel that [non-competes] should be allowed. You are stuck at employers and they can treat you in any manner that they please because they know that they can make your life a living hell if you leave them.[513]
- Like many new graduates in the medical field, I signed on with a company that made numerous empty promises. . . . What I was not prepared for, was the company's strategic increase in facilities in which I was to perform services under this contract. In the short span of 2 years, I did neurophysiological monitoring for 24 facilities . . . . When working conditions fell apart regardless of my requests for adequate sleep following 36 hours straight of working on call at my designated stroke hospital, time for meals or breaks within 18+ hour work days, and a reasonable travel distance within the area the company demanded I relocate to, I was met with threats from HR regarding my non-compete if I were to leave. . . . Working conditions became so intense, I was placed on migraine medications at the recommendations of my doctor and required three separate trips in the ER for medical conditions related to stress, inability to eat or drink while tied within tens of hours long surgeries . . . . Again I was met with threats from HR and now their legal team.[514]

Many commenters stated that non-competes harm working conditions for lower-wage workers. However, there were many commenters in higher-wage jobs who also stated that non-competes harmed their working conditions. For example, numerous physicians explained that they were trapped in jobs with poor working conditions because of non-competes. Many of these physicians described how non-competes accelerate burnout in their profession by making it harder for workers to escape bad working conditions or demand better working conditions. Many commenters recounted how they left poor work environments but non-competes harmed them by forcing them to leave their field, move out of the area where they lived, or spend time and money defending themselves from legal action. Many commenters argued that prohibiting non-competes would increase workers' bargaining power and in turn incentivize employers to provide better work environments.

Workers in both high-wage and low-wage professions, as well as worker advocacy groups, stated that by diminishing workers' competitive alternatives, non-competes keep workers trapped in jobs where they experience dangerous, abusive, or toxic conditions; discrimination; sexual harassment; and other forms of harassment. These commenters also described how non-competes trap some workers in jobs where their employer commits wage and hour violations, such as wage theft, as employers that use non-competes can insulate themselves from the free and fair functioning of competitive markets and are thus more likely to be able to steal worker wages with impunity. Several commenters said they were unable to receive benefits because a non-compete rendered them unable to switch to a job with better benefits or rendered them unable to leave their job when their employer took their benefits away. A professional membership network for survivors of human trafficking explained that traffickers masquerading as legitimate businesses use non-competes to prevent trafficking victims from leaving.

Some workers and advocacy organizations stated that non-competes increase the potential for harm from retaliation. These commenters stated that restricting a worker's employment opportunities makes it even harder for workers to find new jobs after experiencing retaliation. These commenters argued that this discourages workers from reporting fraud, harassment, discrimination, or labor violations. A labor union commented that, by making it harder for workers to find new jobs, non-competes can deter unionization and chill activities protected by the National Labor Relations Act, including activities to address unsafe, unfair, or unsatisfactory working conditions. According to a trade organization of attorneys, whistleblower protections may come too late for a fired whistleblower who cannot obtain another job because of a non-compete. Several commenters provided survey or case evidence showing that workers who report sexual harassment, wage theft, or poor working conditions are frequently retaliated against, including by being fired.[515] These commenters stated that, because non-competes make it harder for these workers to find new jobs, non-competes decrease the likelihood that workers report these kinds of harms.

Many workers described how, by limiting their ability to get out of harmful workplace environments, non-competes contributed to stress-related physical and mental health problems. Many commenters, particularly in the healthcare profession, stated that suicide is a major problem in their profession and described non-competes as one of the stressors, because non-competes make it harder to leave jobs with unsustainable demands, leaving workers feeling trapped.

While thousands of commenters described, often in personal terms, how non-competes have negatively affected their working conditions, the Commission received few comments from workers or worker advocates stating that non-competes improved working conditions. The few comments received stated that workers who remain with an employer can be harmed by departing and competing colleagues, via increased workloads or harm to their employer.

Taken together, these comments provide strong qualitative evidence that non-competes degrade working conditions, which supports the Commission's finding that non-competes tend to negatively affect competition in labor markets.

b. Non-Competes Tend to Negatively Affect Competitive Conditions in Product and Service Markets

Based on the Commission's expertise and after careful review of the rulemaking record, including the empirical research and the public comments, the Commission finds that non-competes tend to negatively affect competitive conditions in markets for products and services by inhibiting new business formation and innovation.

New businesses are formed when new firms are founded by entrepreneurs or spun off from existing firms. New business formation increases competition by reducing concentration, bringing new ideas to market, and forcing incumbent firms to respond to new firms' ideas instead of stagnating. New businesses disproportionately create new jobs and are, as a group, more resilient to economic

[513] Individual commenter, FTC–2023–0007–3955.
[514] Individual commenter, FTC–2023–0007–1252.

[515] For example, the National Women's Law Center, which operates and administers the TIME'S UP Legal Defense Fund, reported that among individuals who contacted the Fund to request legal assistance related to sexual harassment in the workplace, 72% reported facing retaliation, and, among those, 36% had been fired. Comment of Nat'l Women's L. Ctr., FTC–2023–0007–20297 at 5 (citing Jasmine Tucker & Jennifer Mondino, *Coming Forward: Key Trends and Data from the TIME'S UP Legal Defense Fund,* 4 (Oct. 2020), *https://nwlc.org/wp-content/uploads/2020/10/NWLC-Intake-Report_FINAL_2020-10-13.pdf*).

downturns.[516] With respect to spinoffs, research shows that spinoffs within the same industry are highly successful relative to other entrepreneurial ventures.[517]

Non-competes, however, tend to negatively affect competitive conditions in product and service markets by inhibiting new business formation in two ways. First, since many new businesses are formed by workers who leave their jobs to start firms in the same industry, non-competes reduce the number of new businesses that are formed in the first place.[518] Second, non-competes deter potential entrepreneurs from starting or spinning off new businesses—and firms from expanding their businesses—by locking up talented workers.[519] Non-competes thus create substantial barriers to potential new entrants into markets and also stymie competitors' ability to grow by making it difficult for those entrants to find skilled workers.

Innovation refers to the process by which new ideas result in new products or services or improvements to existing products or services. Innovation may directly improve economic outcomes by increasing product quality or decreasing prices, and innovation by one firm may also prompt other firms to compete and improve their own products and services. However, non-competes tend to negatively affect competitive conditions in product and service markets by inhibiting innovation.

Non-competes tend to reduce innovation in three ways. First, non-competes prevent workers from starting businesses in which they can pursue innovative new ideas.[520] Second, non-competes inhibit efficient matching between workers and firms.[521] Where workers are less able to match with jobs that maximize their talents, employers' ability to innovate is constrained. Third, and relatedly, non-competes reduce the movement of workers between firms.[522] This decreases knowledge flow between firms, which limits the cross-pollination of innovative ideas.

As described in Parts IV.B.3.b.i and ii, the Commission finds that the effects of non-competes on new business formation and innovation are sufficient to support its finding that non-competes tend to negatively affect competitive conditions in product and service markets. In addition, as described in Parts IV.B.3.b.iii and iv, the Commission believes this finding is further bolstered by evidence that non-competes increase concentration and consumer prices, as well as evidence that non-competes reduce product quality.

The Commission's findings relating to new business formation and innovation are principally based on the empirical evidence described in Parts IV.B.3.b.i and ii. However, the comments provide strong qualitative evidence that bolsters these findings. Furthermore, the Commission notes that the legal standard for an unfair method of competition under section 5 requires only a tendency to negatively affect competitive conditions; empirical evidence of actual harm is not necessary to establish that conduct is an unfair method of competition. In the case of non-competes, however, there is extensive empirical evidence, as well as extensive corroborating public comments, that non-competes negatively affect competitive conditions in product and service markets.

i. Non-Competes Inhibit New Business Formation

Evidence of Inhibited New Business Formation

The Commission finds that non-competes tend to negatively affect competitive conditions in product and service markets by inhibiting new business formation. The weight of the empirical evidence establishes that when non-competes become more enforceable, the rate of new business formation (*i.e.,* the number of new businesses formed) declines.

Several empirical studies assess the effects of non-competes on the rate of new business formation. A study conducted by Jessica Jeffers examines several State law changes in the technology sector and the professional, scientific, and technical services sector and finds a decline in new firm entry when non-competes become more enforceable. Jeffers finds that as non-competes became more enforceable, the entry rate of new firms decreases substantially.[523] Jeffers' study uses several changes in non-compete enforceability that are measured in a binary fashion. While this study therefore does not satisfy all the principles outlined in Part IV.A.2, it satisfies most of them and is accordingly quite robust and weighted highly.

Another study, conducted by Matt Marx, examines the impact of several changes in non-compete enforceability between 1991 and 2014 on new business formation, and likewise finds a negative effect of non-competes on new business formation.[524] Marx finds that, when non-competes become more enforceable, men are less likely to found a rival startup after leaving their employer, that women are even less likely to do so (15% less likely than men), and that the difference is statistically significant.[525] This study therefore supports both that non-competes inhibit new business formation and that non-competes tend to have more negative impacts for women than for men. Marx uses several changes in non-compete enforceability measured in a continuous fashion. The study therefore satisfies the principles outlined in Part IV.A.2 and is weighted highly.

In addition, Johnson, Lipsitz, and Pei analyze the extent to which non-compete enforceability affects the rate of firm entry in high-tech industries. They find that an average increase in non-compete enforceability decreases the establishment entry rate by 3.2%.[526] Outside of examining only innovative industries, this study's methodology is otherwise strong, and the study is therefore weighted highly. While this study uses multiple changes in a granular measure of non-compete enforceability, a quite robust methodology, the study is limited to high-tech industries.

In addition, a study conducted by Can and Fossen indicates that decreases in enforceability of non-competes in Utah and Massachusetts increased entrepreneurship among low-wage workers.[527] Can and Fossen examine just two changes in non-compete enforceability, measured in a binary fashion, and the study is therefore given slightly less weight than studies which

examine more changes or use a more granular measure of enforceability. The study corroborates the results of studies using these stronger methodologies.

Furthermore, a study conducted by Benjamin Glasner focused on high-tech industries finds that technology workers increased entrepreneurial activity in Hawaii after non-competes were restricted, but finds no effect on entrepreneurial activity from Oregon's restriction on non-competes with low-wage workers.[528] Similar to the study by Can and Fossen, this study by Glasner uses two changes in non-compete enforceability measured in a binary fashion. Additionally, a study published by Stuart and Sorenson shows that increased enforceability of non-competes decreases the amount by which firm acquisitions and IPOs induce additional local business formation.[529] This study uses cross-sectional variation in non-compete enforceability measured in a binary fashion, and studying the amount by which firm acquisitions and IPOs induce additional local business formation does not cover all entrepreneurship. These studies are thus given more limited weight, but generally are in line with other evidence that non-competes reduce new business formation and innovation.

Additionally, a study conducted by Starr, Balasubramanian, and Sakakibara analyzes the effect of non-compete enforceability on spinouts (*i.e.,* when a firm creates a new business by splitting off part of its existing business). The authors find that, when non-compete enforceability increases by one standard deviation, the rate of spinouts within the same industry decreases by 32.5%—a major decrease in new business formation.[530] Research shows that spinouts within the same industry are highly successful, on average, when compared with typical entrepreneurial ventures.[531] This study uses cross-sectional differences in non-compete enforceability, measured in a continuous fashion, though it attempts to avoid problems related to the use of cross-sectional differences in non-compete enforceability by using law firms—which likely do not use non-competes due to ethical limits in the legal profession [532]—as a control group. The Commission therefore gives this study somewhat less weight than studies of changes in non-compete enforceability, though the findings corroborate the findings of the studies by Jeffers and Marx.

In addition, a study by Salomé Baslandze shows that non-competes reduce new business formation, finding that greater non-compete enforceability inhibits entry by spinouts founded by former employees of existing firms.[533] Baslandze notes that spinouts tend to innovate more and are relatively higher quality than other new firms. This study examines changes in non-compete enforceability on a continuous measure but assumes that changes over a 19-year period occur smoothly over time instead of identifying exactly when the legal changes were made. While this study uses changes in non-compete enforceability and corroborates the findings of the aforementioned studies on new business formation, the assumption regarding the timing of changes yields an imprecise measure of non-compete enforceability over time. The Commission therefore gives this study somewhat less weight than studies which precisely identify the timing of changes in non-compete enforceability.

Finally, in a 2011 study, Samila and Sorenson find that when non-competes are more enforceable, rates of entrepreneurship, patenting, and employment growth slow. They find that an increase in venture capital funding creates three times as many new firms where non-competes are unenforceable, compared to where non-competes are enforceable.[534] This study uses cross-sectional variation in non-compete enforceability along two dimensions, both of which are measured in a binary fashion. Due to this measurement, the Commission gives this study less weight, though its results corroborate the findings of the other studies on new business formation.

The Commission gives minimal weight to two additional studies. One of these estimates the job creation rate at startups increased by 7.8% when Michigan increased non-compete enforceability.[535] However, the Commission places less weight on this study than the studies discussed previously because it examines only one legal change in one State and because the change to non-compete enforceability was accompanied by several other simultaneous changes to Michigan's antitrust laws. Thus, it is not possible to isolate the effect of the change in non-compete enforceability standing alone.

The other study finds mixed effects of non-compete enforceability on the entry of businesses into Florida. The study examines a legal change in Florida which made non-competes more enforceable. The authors find larger businesses entered the State more frequently (by 8.5%) but smaller businesses entered less frequently (by 5.6%) following the change.[536] Similarly, Kang and Fleming find that employment at large businesses rose by 15.8% following the change, while employment at smaller businesses effectively did not change.[537] This study examines a single change in non-compete enforceability. However, the Commission gives this study minimal weight because the study does not examine new business formation specifically; instead, it assesses the number of ''business entries,'' which does not necessarily reflect new business formation because it also captures existing businesses moving to the State.

Additional research analyzes the effects of non-competes on the number of jobs created by new businesses.[538]

[538] In the NPRM, the Commission stated that the evidence relating to the effects of non-competes on job creation was inconclusive. However, in the final rule, the Commission does not make a separate finding that non-competes reduce job creation.

While the research described previously shows that non-competes inhibit the rate of new business formation, this research indicates that even where new businesses are created, these new businesses have fewer workers where non-competes are more enforceable. This evidence suggests that non-competes not only prevent small businesses from being formed, but they also hinder entrepreneurship by tending to reduce the number of employees new firms are able to hire.

In addition to analyzing the rate of firm entry in high-tech industries, Johnson, Lipsitz, and Pei analyzes the number of jobs created at newly founded firms in innovative industries.[539] Using evidence from several State law changes, the authors find that increases in non-compete enforceability lead to a reduction in the number of jobs created at newly founded firms in innovative industries (though not necessarily across all industries or all types of firms) by 7.2%.[540]

A study by Starr, Balasubramanian, and Sakakibara finds that increases in non-compete enforceability decreased average per-firm employment at new firms.[541] In the NPRM, the Commission stated that this study found that several increases in non-compete enforceability were associated with a 1.4% increase in average per-firm employment at new firms.[542] However, upon further review of the study, the Commission interprets this study as finding that increases in non-compete enforceability decreased average per-firm employment at new firms—both for spinouts within the same industry and spinouts into a different industry.[543] For spinouts into a different industry, average per-firm employment at the time of founding decreases by 1.4% due to greater non-compete enforceability. For spinouts into the same industry, average per-firm employment decreases by 0.3%.[544] At seven years after founding, the results are similar: spinouts into a different industry have average per-firm employment that is 1.5% lower due to greater non-compete enforceability, while spinouts into the same industry have per-firm employment that is 0.7% lower.[545] The Commission notes that this study compares States with different levels of enforceability, using law firms as a control group, instead of considering changes in non-compete enforceability. It is therefore given less weight than studies with stronger methodologies.[546]

Comments Pertaining to Inhibited New Business Formation and the Commission's Responses

The Commission's finding that non-competes inhibit new business formation is principally based on the empirical evidence described in this Part IV.B.3.b.i. However, the comments provide strong qualitative evidence that bolsters this finding.

Hundreds of commenters agreed with the Commission's preliminary finding that non-competes reduce new business formation. Illustrative examples of comments the Commission received include the following:

- I am a hairstylist . . . and have been with the company for 11 years. Our work conditions have changed drastically over the years and Covid has really sent us on a sharp decline. It is not the same salon I signed on to work for. That being said, a few coworkers want to open a salon and take some of us with them to bring back the caliber of service we want to give our clients. Our non-compete contracts state that we can't work within 30 miles of this salon. We didn't expect that standards would drop so low and they would raise prices so high that we lost so many clients. . . . We have all had enough of the toxic environment and need to be free of this unfair contract.[547]
- I am a veterinarian that has had to suffer under non-compete clauses my entire career. I have had to sell my home and relocate several times including moving out of State due to non-compete clauses. I'm currently stuck in a [non-compete covering a] 30 mile radius of all 4 practices of a group of hospitals I work for. This basically keeps me from working in an enormous area. I had to sign it due to circumstances out of my control and they took advantage of my situation. I recently tried to start my own business, not related to the type of practice that I have the non-compete clause with, and had to abandon the idea because I couldn't get funding without my current employer releasing me from the contract or by relocating again out of the huge area of non-compete.[548]
- We own a small family practice in urban Wisconsin. I previously was employed by a large healthcare organization and burned out. When I left to star[t] my own business, I was restricted from working close by, by a non-compete. I spent $24,000 [in] legal fees challenging this successfully. . . . Now as a business owner for 5 years, we have the opportunity to hire some physician assistants who have been terminated without cause from my prior employer. I am unable to do so because they also had to sign non-competes. I have seen many disgruntled patients who have delayed care because of this.[549]
- I am aesthetic nurse practitioner wanting to start my own business but I am tied to a 2 year 10 mile non compete. I was basically obligated to sign the non-compete when I needed to reduce my hours to finish my master's degree (that I paid for and they wanted me to get). I feel forced to stay at a job that is not paying me what I am worth.[550]
- I am a licensed social worker with a non-compete which is hindering my employment options. . . . I would like to start my own business as the mental health facility I work for is not supportive of mental health. This rule would be a great benefit for mental health professionals and those seeking quality mental health services.[551]
- As a recently graduated physician, I wanted to start my own practice and become a small business owner. However, I also needed a source of income to start out and wanted to work part time at a local hospital for income and benefits. However, due to a non-compete clause in their contracts, I could not start my own business and practice in the same city if I was to work with them. This hindered my ability to work as much as I wanted (ended up having to work as an independent contractor for significantly less

Instead, it cites the research described herein—which relates solely to job creation at newly founded firms—to support its finding that non-competes inhibit new business formation.

[539] Johnson, Lipsitz, and Pei, *supra* note 526 at 36.

[540] *Id.* While this study satisfies each of the other metrics outlined in Part IV.A.2, the sample is restricted to firms in innovative industries, and therefore the outcome of interest is not reflective of the entire population.

[541] Starr, Balasubramanian, & Sakakibara, *supra* note 518 at 552.

[542] NPRM at 3488–89.

[543] While this study satisfies some of the principles for robust design outlined in Part IV.A.2, the Commission notes that average per-firm employment does not precisely correspond to the economic outcome of interest, which is overall employment or job creation.

[544] Calculated as 1.4% − 1.1%, based on the effect for non-within-industry spinouts (1.4%) and the relative impact on within-industry spinouts compared with non-within-industry spinouts (− 1.1%). *See* Starr, Balasubramanian, & Sakakibara, *supra* note 518 at 561.

[545] Calculated as 1.5% − 0.7%, based on the effect for non-within-industry spinouts (1.5%) and the relative impact on within-industry spinouts compared with non-within-industry spinouts (− 0.8%). *See id.* at 563.

[546] There are also two studies analyzing how non-competes affect job creation or employment generally. Neither study relates to new business formation specifically. Goudou finds a decreased job creation rate from an increase in non-compete enforceability in Florida. Felicien Goudou, *The Employment Effects of Non-compete Contracts: Job Retention versus Job Creation* (2023), *https://www.jesugogoudou.me/uploads/JMP_Felicien_G.pdf*. This study considers just one change in non-compete enforceability, and is therefore given less weight, though the results corroborate findings in papers which satisfy more of the guideposts in Part IV.A.2. Additionally, the 2023 version of Johnson, Lavetti, & Lipsitz, *supra* note 388, finds that increased non-compete enforceability reduces employment by 1.9%, though they do not estimate the impact on job creation directly. Rather, the authors look only at the closely related metric of changes in overall employment. This study otherwise has a strong methodology, as discussed in Part IV.B.3.a.ii.

shifts per month and no benefits), and made it more difficult to get my business off the ground due to expenses for providing my own benefits. Banning non-compete clauses would significantly help the ability for citizens to pursue starting small businesses or other work to increase their income and prosperity.[552]

- Mr. Z had worked for a company for over 15 years installing windshields in vehicles. He was a lower-level employee making $18.50 an hour and did not learn any trade secrets or confidential information. After years of working for the company the employer refused to raise his wages despite his experience, so he decided to start his own business. Shortly after giving notice and beginning his new endeavor, he received a letter from his previous employer informing him that he was in breach of his non-compete agreement and the employer would enforce it if he continued with his business plan.[553]
- Non-competes have prohibited me from making a living as a fitness and wellness professional to such an extent, that it hurt me economically. I opened up my own business that was different than my previous employer, even though it was different and I told him I was going to focus on a different area in wellness, my previous employer sued me. I ended up having to hire an attorney to defend myself and when it was all said and done, I spent close to 12,000 in fees and penalties.[554]
- Non compete agreements are detrimental to the average worker, preventing them from pursuing better paying job offers or from starting their own business in the same industry. I am directly affected by a non-compete clause I had signed as part of a job acceptance. I am now forming my own business in the same industry as my employer, and cannot do business within a 50-mile radius of my employer. That radius covers the hometown I live in. Even though we are in the same industry, we have very different target markets.[555]

As these comment excerpts reflect, many potential entrepreneurs wrote to the Commission to describe how they wanted to strike out on their own, but a non-compete preventing them from doing so. These comments indicate that non-competes have deprived communities of homegrown businesses—with respect to everything ranging from tech companies, to hair salons, to physician practices, and many more types of firms. This deprives markets of competing firms that can reduce concentration—which in turn has benefits for lowering prices and raising the quality of products and services, and increasing innovation in bringing new ideas to market—as well as depriving communities of opportunities for new job creation.

Even where entrepreneurs were able to start businesses, they explained how non-competes prevented them from hiring talented workers and made it harder for their nascent businesses to grow and thrive. Many other commenters described personal experiences in which their newly formed businesses were threatened by litigation costs related to non-competes. Other commenters stated that the threat of litigation related to non-competes increases the risk and cost of starting a new business, particularly if that business intends to compete against a large incumbent firm. One commenter stated that incumbent firms can use non-compete litigation as a mechanism to chill startup formation where startups lack the resources to contest a non-compete.

Numerous small businesses and organizations representing small businesses submitted comments expressing support for the proposed rule and describing how it would help small business owners. These commenters contend that categorically prohibiting non-competes will empower small businesses by providing them with new access to critical talent and will drive small business creation as entrepreneurial employees will be free to compete against their former employers. Many small businesses also argued that non-competes can hinder small business formation and can keep small businesses from growing once they are formed. The extensive comments the Commission received from small businesses are also addressed in Part XI.C.

Some small businesses said they spent tens or hundreds of thousands of dollars defending themselves from non-compete lawsuits. A one-person surveying firm said it has to regularly turn down work because of the former employer's threat to sue over a non-compete. A small, five-worker firm said it was sued by a billion-dollar company for violating a non-compete despite the fact that the firm waited out the non-compete period and did not use proprietary information or pursue the former employer's customers; it fears the legal fees will force it out of business. A legal aid organization relayed the story of a client, a self-employed beauty worker who was unable to provide their service during a non-compete lawsuit despite working outside the non-compete geographic radius. The CEO of one small transport and logistics company said a ban would remove a tool used mostly by the largest companies in each industry to maintain their market dominance, as small competitors cannot match their legal budgets. Further, many workers said they would open their own business if non-competes were banned.

Many small businesses shared their experiences of how non-competes have made hiring more difficult. For example, a small physician practice said non-competes made it difficult to compete with larger practices to attract and retain physicians. A small business and a medical association said small businesses could not afford a lawsuit when hiring workers. An IT startup tried to hire an executive who had retired from a large firm, but the large firm sued the startup to enforce what the startup said was an unenforceable non-compete. According to the startup, because a lawsuit would have cost up to $200,000, it was forced to settle and could not work with numerous potential clients, and its growth was significantly slowed. It stated that it continues to turn away many potential hires to avoid being sued over non-competes.

Other commenters raised additional issues relevant to hiring. According to one technology startup organization, the inability to assemble the right team is a major reason startups fail, and small businesses lose opportunities because they must avoid hiring workers who are subject to even unenforceable non-competes. That organization also said startups currently face legal and time costs from navigating the patchwork and complexity of State non-compete laws, especially when trying to determine if a potential hire's non-compete is enforceable; the time and expense of navigating this landscape will thus often cause the startups to forego that hire. That organization said some non-competes prevent experienced workers from counseling, advising, or investing in startups, and such mentoring can double a startup's survival rate.

Several self-identified entrepreneurs commented that because of their non-competes, they feared not being able to operate, build, or expand their business. Numerous workers reported that they wanted to or planned to start their own business, but their non-compete made them too afraid to do so. A public policy organization referenced the Census Bureau's Annual Business Survey to argue that a majority of business owners and an even higher majority of Black business owners view starting their own business as the best avenue for their ideas, and that non-competes may prevent these potential entrepreneurs' ideas from coming to market.

Several commenters stated that non-competes make it harder for new businesses to hire workers with relevant

[555] Individual commenter, FTC–2023–0007–12697.

experience or industry knowledge. Some commenters argued that non-compete bans, such as in California, have contributed to higher rates of successful start-ups, while new firms in States where non-competes are more enforceable tend to be smaller and are more likely to fail.

In contrast, several commenters opposed to the rule argued that non-competes promote new business formation by protecting small and new firms' investments, knowledge, and workers from appropriation by dominant firms poaching their employees. Commenters also theorized that, while non-competes directly inhibit employee spinoffs, they may encourage businesses to enter the market by enhancing their ability to protect their investments. As described in Part IV.D.2, the Commission finds that firms have viable alternatives for protecting these investments that burden competition to a less significant degree than non-competes. The Commission further notes that these commenters did not provide evidence to support their assertions.

In addition, when assessing how non-competes affect new business formation, the Commission believes it is important to consider the net impact. It is possible that the effects described by these commenters and the effects described by the Commission earlier in this Part IV.B.3.b.i can be occurring at the same time. That is, a non-compete might in some instances be protecting a firm's investments in a manner that is productivity-enhancing holding all else equal. But even that same non-compete can—and certainly non-competes in the aggregate do—inhibit new business formation by prohibiting workers from starting new businesses and by locking up talented workers, preventing the worker from efficiently matching with the job that is the highest and best use of their talents. What the empirical evidence shows is that non-competes reduce new business formation, overall and on net, indicating that the tendency of non-competes to inhibit new business formation more than counteracts any tendency of non-competes to promote new business formation.

Other commenters said non-competes protect firms' value and assets for sale in future acquisitions, which they said drives seed capital investment in start-ups. An investment industry organization commented that private-equity financing, particularly for early-stage companies, often includes non-competes and is used to support growth, in turn increasing competition. In response, the Commission notes that these commenters provided no empirical evidence that decreases in non-compete enforceability have affected seed capital investment and private-equity financing. Moreover, the Commission notes that there is no indication that small businesses or early-stage companies in States that have banned or limited non-competes have been unable to obtain financing. To the contrary, California, where non-competes are unenforceable, has a thriving start-up culture.

Other commenters addressed empirical research related to new business formation. Some commenters similarly argued that research on the average quality of employee spinouts due to changes in non-compete enforceability may imply negative effects of the rule (*e.g.,* if prohibiting non-competes decreases average employment or average survival rates of new firms). Some commenters also noted that the Baslandze study finds that weaker non-compete enforceability increases the rate at which spinouts form but result in a lower proportion of high-quality spinouts.[556]

In response to these comments, the Commission notes commenters primarily referenced Starr, Balasubramanian, & Sakakibara[557] to support this view. The findings in this study have been misinterpreted by commenters. This study actually finds that spinouts that form when non-compete enforceability is stricter are *lower* quality (*i.e.,* create fewer jobs), but that the effect is less drastic for spinouts within the same industry versus spinouts into different industries. Coupled with other evidence discussed in Part IV.B.3.b.i, the weight of which points to increased job creation due to the rule, the Commission finds that empirical studies have not established that non-competes lead to higher-quality startups or higher-quality spinouts. The Commission also notes that the result in the Baslandze study regarding the quality of spinouts is theoretical, and the study does not test this theory empirically.

Commenters also argued that non-competes may have different effects on different types of workers—for example, across different industries, occupations, or levels of pay—and that these differences may affect the impacts of non-competes on new business formation. In response, the Commission notes that the studies show negative effects across a range of industries and are directionally consistent, even if they do not provide results for all subgroups.

Commenters asserted that non-competes may affect job creation through several different mechanisms. The Commission agrees and finds that, regardless of the specific mechanism, the weight of the evidence indicates that non-competes inhibit job creation.

Commenters opposing the rule also questioned the usefulness of studies of Michigan's law change, given that existing non-competes remained enforceable under the Michigan law; they state that as a result, it would take longer for effects from the law to be realized. As noted under ''Evidence of inhibited new business formation,'' the Commission gives minimal weight to this study, but for other reasons.

In an ex parte communication entered into the record, the author of the study of the Michigan law change expressed concern over the Commission's interpretation of the study.[558] In particular, he stated that his methodology mitigated concerns that the study's findings of an increase in the job creation rate may be due to decreases in that rate's denominator (total employment). While the Commission does not agree with this assessment,[559] the Commission places less weight on the study for different reasons, as noted.

Some commenters who opposed the rule also addressed the evidence relating to non-competes and job creation, although these commenters generally did not focus on job creation related to new businesses specifically. Some of these commenters asserted that the studies addressed in the NPRM indicated that non-competes are associated with a greater number of jobs available and increased rates of job creation, rather than decreased rates of job creation. Some asserted that the evidence on job creation is mixed and that the issue is understudied. In the NPRM, the Commission stated that the evidence relating to the effects of non-competes on job creation was inconclusive. However, in the final rule,

[556] Baslandze, *supra* note 533 at 40.

[557] Starr, Balasubramanian, & Sakakibara, *supra* note 518.

[558] Ex Parte Communication: Email from G. Carlino to E. Wilkins (Jan. 30, 2023), *https://www.ftc.gov/system/files?file=ftc_gov/pdf/P201200NonCompeteNPRMExParteCarlinoRedacted.pdf.*

[559] In particular, the long time period and the difference-in-difference methodology used in the study do not mitigate concerns that decreases in employment due to non-compete enforceability could drive increases in the job creation rate. The concern is not that the findings somehow represent effects on anything other than the average job creation rate (as noted by the author in his ex parte communication), but that a rate is comprised of a numerator and denominator, and effects on either may drive effects on the rate as a whole. This concern is shared by at least two empirical studies of non-competes. *See* Johnson, Lavetti, & Lipsitz *supra* note 388 at 19 and Johnson, Lipsitz, & Pei *supra* note 526 at 19.

the Commission does not make a separate finding that non-competes reduce job creation. Instead, it cites the research described herein—which relates to job creation at newly founded firms—to support its finding that non-competes inhibit new business formation.

ii. Non-Competes Inhibit Innovation

Evidence of Inhibited Innovation

The Commission finds that non-competes tend to negatively affect competitive conditions in product and service markets by inhibiting innovation. Three highly reliable empirical studies find that non-competes reduce innovation.

One such study, a study by Zhaozhao He, finds that the value of patents, relative to the assets of the firm, increases by about 31% when non-compete enforceability decreases.[560] In contrast to some other studies of innovation discussed here, He's study focuses on the value of patents, rather than the mere number of patents. The study does so to mitigate concerns that patenting volume may not represent innovation.[561] The study analyzes the impact of several legal changes to non-compete enforceability, using a binary measure of non-compete enforceability. While this study therefore does not satisfy all the principles outlined in Part IV.A.2, it nonetheless satisfies many of them and contains a reasonably strong methodology.

A second study, by Johnson, Lipsitz, and Pei, finds that increased enforceability of non-competes decreases the rate of ''breakthrough'' innovations and innovations which make up the most cited patents. This study lends weight to the finding that non-competes harm both the quantity and the quality of innovation.[562] The authors also show that when non-compete enforceability decreases, patenting increases even in industries where most new innovations are patented. These increases imply that the effect is a true increase in innovation, rather than firms substituting between patents and non-competes.

Johnson, Lipsitz, and Pei also show that State-level changes in non-compete policy do not simply reallocate innovative activity across State lines, which would result in no change in innovation at the national level. Instead, they find that decreasing non-compete enforceability, even in one State, increases innovative activity nationally.[563] Johnson, Lipsitz, and Pei's study uses several legal changes to analyze the impact of enforceability. It also uses several metrics of quality and quantity to mitigate concerns over whether patenting is an accurate reflection of innovation, especially in this context. The study thus satisfies all the principles outlined in Part IV.A.2 and is therefore given substantial weight by the Commission.

A third study, by Rockall and Reinmuth, finds that non-competes have a significant negative impact on innovation. They further find that this effect is not driven solely by the entry of new businesses. Their work suggests a potentially central role for knowledge spillovers, which are hampered when worker mobility is diminished. The study uses many changes to non-compete enforceability quantified on a continuous basis and considers several metrics which represent the quantity and quality of patenting, in order to accurately capture the relationship between non-competes and innovation.[564] Similar to the study by Johnson, Lipsitz, and Pei, this study therefore satisfies all the principles described in Part IV.A.2 and is given substantial weight.

The Commission places the greatest weight on the foregoing three studies, in which factors unrelated to the legal changes at issue are less likely to drive the results. There are additional studies that relate to non-competes and innovation, but the Commission gives them less weight.

A study by Samila and Sorenson finds that venture capital induced less patenting by 6.6 percentage points when non-competes are enforceable.[565] However, the authors note that patenting may or may not reflect the true level of innovation, as firms may use patenting as a substitute for non-competes where they seek to protect sensitive information.[566] Furthermore, this study assesses only the quantity of patents and does not take into account the quality of patents, which would be a better proxy for innovation. For this reason, the Commission gives less weight to this study (although its findings are directionally consistent with the first three studies described herein). This study also uses cross-sectional variation in non-compete enforceability, which is measured along two dimensions in a binary fashion. In addition, a study by Gerald Carlino examined how patenting activity in Michigan was affected by an increase in non-compete enforceability. The study finds that mechanical patenting increased following the change in the law, but that drug patenting fell, and that the quality of computer patents fell.[567] However, the increase in mechanical patenting appears to have primarily occurred approximately 14 years after non-compete enforceability changed. This suggests that some other mechanism may have led to the increase in patenting activity.[568] Moreover, the study uses a single change in non-compete enforceability to generate its results, and it uses only one measure of innovation outside of patent quantity—quality as measured by patent citations. Finally, this study examines a change to non-compete enforceability which was accompanied by several other changes to Michigan's antitrust laws, making it impossible to identify the effect of the change in non-compete enforceability standing alone. For these reasons, the Commission gives less weight to this study.

A study by Clemens Mueller does not estimate the overall impact of non-compete policy on innovation, but instead focuses on career detours of inventors.[569] Mueller shows that inventors are more likely to take ''career detours''—that is, to change industries to avoid the reach of their non-compete—when enforceability of non-competes is stricter. Due to the lower match quality between that inventor and their new industry, the innovative productivity of those inventors suffers after they take career detours. However, the Commission assigns this study less weight because, while its methodology satisfies the principles outlined in Part IV.A.2, the study is only informative of the productivity of individuals taking career detours. It does not address whether innovation in the aggregate increases. Mueller uses several changes in non-compete enforceability to generate results, but those changes are measured in binary—rather than continuous—fashion.

Coombs and Taylor examine the impact of non-compete enforceability on innovation. They find that research

productivity, as measured by the number of products in biotechnology firms' prospectuses, was lower in California than other States, which they suggest implies that California's ban on non-competes hampers research productivity.[570] However, this study is purely cross-sectional, and results may be due to other differences between California and other States; the Commission accordingly places less weight on this study.

Two additional studies address firm strategies related to innovation. However, the Commission gives them little weight because the outcomes studied do not inform how non-competes would affect the overall level of innovation in the economy. The first, by Raffaele Conti, uses two changes in non-compete enforceability (in Texas and Florida), and indicates that firms engage in riskier strategies with respect to research and development (''R&D'') when non-compete enforceability is greater.[571] However, this study does not address whether these riskier strategies lead to greater innovation. The second, by Fenglong Xiao, finds that increases in non-compete enforceability led to increases in exploitative innovation (*i.e.,* innovation which stays within the bounds of the innovating firm's existing competences) in the medical device industry.[572] The study finds this increase in exploitative innovation leads to an increase in the rate at which new medical devices are introduced. However, the study also finds that explorative innovation (*i.e.,* innovation which moves outside those bounds) decreased, and explorative innovation is the mode of innovation which the empirical literature has found to be associated with high growth firms.[573] The net impact on innovation from this study is thus unclear. The study examines several changes in non-compete enforceability, measured with a binary indicator of non-compete enforceability.

Comments Pertaining to Inhibited Innovation and the Commission's Responses

The Commission's finding that non-competes inhibit innovation is principally based on the empirical evidence described in this Part IV.B.3.b.ii. However, the comments provide strong qualitative evidence that bolsters this finding.

Several academics and economic research groups, among other commenters, agreed with the Commission's preliminary finding that non-competes inhibit innovation. Commenters argued that non-competes reduce knowledge flow and collaboration, force workers to leave their field of expertise, and discourage within-industry spinouts that promote innovation. Many commenters stated that banning non-competes would make it easier for workers to pursue innovative ideas and to hire the best talent to help develop those ideas. Illustrative examples of comments the Commission received include the following:

• I am a geneticist at Stanford University, and I am co-founding a biotech startup that aims to discover new cancer immunotherapies. Many of the most talented geneticists, immunologists, cancer biologists, and other scientists with unique and valuable skillsets for drug development are bound by non-competes that prevent them from leaving jobs at big pharma companies to join biotech startups like mine. The result is artificial scarcity in the market for top scientific talent—a phenomenon that precludes healthy competition between industry incumbents and new entrants. Given that much of our country's most cutting-edge translational research happens within biotech startups, and given that many of the most successful drugs on the market originate in biotech startups, non-competes in pharma and biotech prevent the most talented scientists from working on the most innovative science and obstruct the development of new treatments and cures for human disease—leaving our society worse off.[574]

• As a practicing Physician for over thirty years, and one who trained fellows in pain management, who followed many of their students' careers, I was able to see the detriments of unfair Non-Compete clauses in their contracts. Often a physician would take a job, and if it did not work out, the restrictions were so severe, that they would need to move to a new geographic location in order to be employed. . . . Other scenarios exist as well. Where large institutions can block scientific discovery of their research physicians from moving to other institutions which may be better able to support their research, potentially blocking the promotion of scientific discovery.[575]

[574] Individual commenter, FTC–2023–0007–0198.

[575] Individual commenter, FTC–2023–0007–3885.

• I am an engineer in the orthopedic space. I have an idea for a truly innovative foot and ankle plating system that I believe could become the standard of care for fracture fixation and foot deformity correction. It could save 10–15 minutes of operating room time per surgery, which studies show carries a cost of $1000 (times millions of surgeries annually). It does not directly compete with my former employer's product, but I have to wait a year to start engaging surgeons about it because of a very broad non-compete, for a product that does not even compete.[576]

• I currently work as a mid-level technical employee at a company that enforces long (a year or longer) noncompetes. . . . After working for larger companies for a few years after college, many of my friends started their own companies. Some succeeded massively and some didn't but what was common among most of them was that the companies they started were somewhat related to what they were working on before. They either saw a gap in the industry while working for a larger company, or had a bold idea in their domains that they wanted to quit their jobs and try executing it. All this risk taking has in turn resulted in innovation, more competition, and hundreds of jobs. This would not have been possible if these people were under non-compete agreements from their previous employers. In fact, many of my friends who are currently working for companies that have non-competes have personally told me that they want to try a different approach than the current incumbents in their industry, but they simply can't take this risk because of the long non-competes they are under. Note that non-competes are even more consequential for workers of relatively less experience because sitting out for 1 year while only having 3 to 4 years of experience is a lot more detrimental to one's career when compared to an individual with 20 years of experience. Given that younger workers are more willing to take risks and try new ideas, the impact of non-competes on innovation is far worse than many think.[577]

• I am an engineer who has worked on software and hardware in several domains, including the semiconductor industry. I perceive non-competes to not only be detrimental to free trade but also to be detrimental to American innovation and manufacturing. If the United States is serious about supporting the growth of the semiconductor industry in the U.S., it must ensure that semiconductor companies inside the United States truly act to benefit American innovation. . . . The FTC would act prudently to ban such agreements.[578]

• I am a physician. I have worked for public entities for my entire career. I have worked under non-competes for my entire career. The result of these non-compete clauses is that myself and my colleagues keep our imagination and creativity locked away. We see novel applications of pharmaceuticals and medical devices which our leadership

[576] Individual commenter, FTC–2023–0007–0760.

[577] Individual commenter, FTC–2023–0007–19807.

[578] Individual commenter, FTC–2023–0007–12872.

does not want to pursue, and we are also precluded from pursuing these ideas due to the noncompete. We see new ways to reach people and help people with our unique skill sets, and our noncompete keeps us from being able to reach them. The noncompete allows our employer to own us. They monopolize the talent of their workforce and this deprives the community of the innovation that may stem from the unleashing of the creativity of the physician workforce. I see the direct impact of non-compete clauses. The public has so much to gain by releasing healthcare workers from their noncompete clauses. These talented individuals, once released from their noncompetes, will begin to contribute to their communities with new ideas and innovation that will serve their communities. Many entities have so many reasons to avoid innovation and this stifles the individuals who work for them and oppresses new ideas. Once released from the bureaucracy and burden of non-competes I believe you will see an abundance of community outreach, device innovation and community service from many physicians currently subjugated by their noncompete clauses.[579]

A research organization said a ban on non-competes would increase the value workers realize from creativity and inventiveness, though it also asserted that non-competes can incentivize firms to create and share information. Some workers commented that they had innovative ideas or research that their employer was unwilling to pursue, but the worker could not leave to pursue their ideas elsewhere. A commenter also argued that captive workforces can stifle competition for workers and for clients or patients that leads to innovation. According to several commenters, trapping workers in jobs can also lead to decreased productivity and so-called ''quiet quitting.''

Some commenters contended that California's ban on non-competes helped Silicon Valley and other industries in California thrive. For example, a public policy organization pointed to industry clusters where studies have identified job hopping, which may otherwise be prohibited by non-competes, as the primary mechanism of knowledge diffusion and argued that restricting non-competes for knowledge workers would improve the U.S.'s competitiveness. Other commenters questioned whether non-competes played a role in Silicon Valley's growth. In response, the Commission notes that it does not attribute California's success in the technology industry to its non-compete laws. The Commission merely notes (in Part IV.D) that the technology industry is highly dependent on protecting trade secrets and that it has thrived in California despite the inability of employers to enforce non-competes, suggesting that employers have less restrictive alternatives for protecting trade secrets.

Other commenters opposing the rule argued that non-competes may promote innovation by encouraging firms to make productivity-enhancing investments and by decreasing the risk of workers leaving. These commenters stated that non-competes protect firms' investments in workers, R&D, intellectual capital, and innovation. The Commission does not believe that non-competes are needed to protect valuable firm investments. As described in Part IV.D.2, the Commission finds that firms have less restrictive alternatives that protect these investments adequately while burdening competition to a less significant degree.

In addition, when assessing how non-competes affect innovation, the Commission believes it is important to consider the net impact. It is possible that the effects described by these commenters and the effects described by the Commission earlier in this Part IV.B.3.b.ii can be occurring at the same time. That is, a non-compete might in some instances be protecting a firm's investments in a manner that is productivity-enhancing holding all else equal. But even that same non-compete can—and certainly non-competes in the aggregate do—inhibit innovation by preventing workers from starting new businesses in which they can pursue innovative ideas; inhibiting efficient matching between workers and firms; and reducing the movement of workers between firms. What the empirical evidence shows is that non-competes reduce innovation, overall and on net, indicating that the tendency of non-competes to inhibit innovation more than counteracts any tendency of non-competes to promote innovation.

The Commission addresses the available evidence on the relationship between non-competes and firm investment in Part IV.D.1.

A business commenter contended that worker mobility does not necessarily improve innovation since the new firm may be unable or unwilling to use the worker's knowledge or ideas, or the new start-up may fail and leave consumers with less innovative products and services. In response, the Commission notes that it is certainly possible that some workers switch jobs to firms that are unable or unwilling to use their knowledge or ideas, or to startups that may fail. However, the fact that the empirical evidence shows that reduced non-compete enforceability increases innovation suggests that these effects are outweighed by workers who can switch jobs to firms that make better use of their talents, or to startups that thrive and bring innovative new products to market.

Other commenters stated that non-competes promote the sharing of ideas and information within firms and incentivize risk-taking. The Commission is not aware of evidence that non-competes promote the sharing of ideas within firms specifically, but in any event the Commission explains in Part IV.D.2 that trade secrets and NDAs provide less restrictive means than non-competes for protecting confidential information. With respect to risk-taking, the Commission notes that the Conti study finds that firms engage in riskier R&D strategies when non-compete enforceability is greater, but it is not clear whether these riskier R&D strategies translate into increased innovation.

Commenters also argued that non-competes may have different effects on different types of workers—for example, across different industries, occupations, or levels of pay—and that these differences may affect the impacts of non-competes on innovation. In response, the Commission notes that the most methodologically robust studies show negative effects across a range of industries and are directionally consistent, even if they do not provide results for all subgroups.

A research organization argued that non-competes decrease the likelihood that innovative technologies are developed outside the U.S. and that non-competes promote economic growth, competitiveness, and national security. The Commission is not aware of any reliable evidence of the effects of non-competes on whether innovative technologies are developed outside the U.S. However, the weight of the empirical evidence indicates that non-competes reduce the amount of innovation occurring within the U.S.

Some commenters noted that innovation hubs have emerged in States that enforce non-competes. In response, the Commission notes that it does not find that it is impossible for innovation hubs to emerge where non-competes are enforceable. Instead, the Commission finds that, overall, non-competes inhibit innovation.

One commenter performed an empirical exercise in which he correlated Global Innovation Index rankings of innovation clusters with the enforceability of non-competes in each location. The commenter found that only one of the top five clusters bans non-competes, and only three others in the top 100 ban non-competes. The

[579] Individual commenter, FTC–2023–0007–2340.

commenter cited the success of Chinese innovation clusters, noting that non-competes are permitted in each of them.[580] The Commission does not find this evidence persuasive. Other differences across countries may explain these results better than policy towards non-competes, which is one factor among many that affect the level of innovation in an economy.

Some commenters argued that the empirical research cited in the NPRM has mixed results. These commenters point to the study by Xiao (2022) showing that non-competes increase exploitative innovation (innovation that incrementally extends firms' existing capabilities), but not explorative innovation (innovation that extends the scope of firms' capabilities). In response, the Commission notes that, within this particular study, the net impact of non-competes on innovation was unclear. But the Commission does not believe the evidence overall is mixed, given that the three empirical studies of the effects of non-competes on innovation that use the most reliable empirical methods all find that non-competes reduce innovation.

Some commenters claimed that two studies cited in the NPRM—the Xiao and Conti studies—had findings that were omitted or misinterpreted: first, the Xiao finding that non-compete enforceability increases the rate of new discoveries of medical devices due to increases in the rate of exploitative innovation but not explorative innovation); and second, the Conti finding that greater non-compete enforceability leads to riskier innovation, which these commenters assert is a positive outcome.[581] In response, the Commission notes that the NPRM described both of these findings and did not omit or misinterpret them.[582] The Commission explains why it gives these studies little weight under ''Evidence of inhibited innovation.''

A commenter asserted that the He study is insufficient evidence to support a finding, and that the study examines the effects of non-compete enforceability on the value of patents, which the commenter asserts misses other aspects of innovation. In response, the Commission believes that the He study is methodologically robust and that, while no single metric can capture all aspects of innovation, the value of patents is a meaningful proxy. The Commission also notes that the effects observed in the He study are considerable, as the study finds that the value of patents, relative to the assets of the firm, increases by about 31% when non-compete enforceability decreases. In addition, the Commission notes that the comment record provides substantial qualitative support in line with the empirical findings. Furthermore, additional research, published since the release of the NPRM, helps confirm the Commission's finding regarding the effect of non-competes on innovation. As described under ''Evidence of inhibited innovation,'' this evidence moves beyond assessing the impact of non-competes on the value of patents or the number of patents to identify the quality of new innovation, as well as the mechanisms underlying these effects.

Many commenters referred to a law review article, which was also submitted as a comment itself, that critiques the literature on non-competes and innovation.[583] First, the authors argue that a measure of enforceability used in part of the economic literature is incorrect and that a more recently developed measure is imperfect but better.[584] The Commission agrees with the authors that the more recently developed measure of enforceability, the scale based on Bishara (2011), is stronger than other measures of enforceability due to its granularity. This metric is used in many studies cited in this final rule, including the Johnson, Lipsitz, and Pei study, which largely reinforces the conclusions in the He study, lending weight to the conclusions in these studies that non-competes suppress the overall level of innovation in the economy.

Second, the authors argue that a given non-compete may be governed by the laws of a State other than the State where the worker lives, which undermines the reliability of studies analyzing the effects of non-compete enforceability. The authors argue that cross-border enforcement of non-competes may be a difficult issue to properly address in empirical work and has not been accounted for in the work to date. In response, the Commission notes that if the State law that applied to a given non-compete were totally random—for example, if a non-compete in Oregon was no more likely to be governed by Oregon's law than any other State's law—we would expect to observe no effects on economic outcomes (such as earnings, innovation, and new business formation) from changes in State law. Instead, the empirical research shows that changes in State law have clear impacts on economic outcomes in particular States. This indicates that enough non-competes within a particular State are subject to that State's law for changes in that State's law to affect economic outcomes in that State.

Third, the authors argue that there is a lack of data on the use of non-competes and that such data are needed to completely assess the effects of non-competes. Although there is not comprehensive data on individual workers' employment agreements, the Commission believes the studies that examine changes in enforceability do so based on sufficient data to be reliable and are otherwise methodologically sound. These studies are also highly probative with respect to the effects of the final rule because what they are examining—how changes in the enforceability of non-competes affect various outcomes—matches closely with what the final rule does. The Commission also notes that there is considerable data regarding the prevalence of non-competes, which it discussed in Part I.B.2.

Fourth, the article argues that some studies of non-competes have small sample sizes, which may lead to measurement error. In response to concerns about small sample sizes, the Commission notes that the most recent studies use a greater breadth of variation in the legal environment surrounding non-competes, overcoming this obstacle. Fifth, the article expresses concern about certain studies that are based on legal changes in Michigan. The Commission takes this critique into account throughout this final rule and notes it when discussing the applicable studies that examine legal changes in Michigan, including under ''Evidence of inhibited innovation.''

In an ex parte communication included in the public record, the author of one of the studies of innovation stated that studies which examine multiple legal changes may be biased, since affected parties may anticipate the legal change and adjust their behavior prior to the date that the legal change is made. The author stated that examination of the legal change in Michigan was therefore preferable, since it was ''inadvertent'' and therefore not

[580] Comment of Mark Cohen, FTC–2023–0007–12064, at 12–13.

[581] Referring to Xiao, *supra* note 572 and Conti, *supra* note 571.

[582] NPRM at 3492–93.

[583] Barnett & Sichelman, *supra* note 389.

[584] The allegedly flawed measures use binary indicators for enforcement versus non-enforcement, or binary indicators for several facets of enforceability (Stuart and Sorenson, *supra* note 529; Mark J. Garmaise, *Ties that Truly Bind: Noncompetition Agreements, Executive Compensation, and Firm Investment,* 27 J. L., Econ., & Org. (2011)), and the more recent measure is more nuanced (Bishara, *supra* note 501).

subject to anticipation effects.[585] The Commission agrees that, in general, anticipation effects can bias the findings of empirical studies. However, empirical work shows that the legal changes used in much of the literature on non-competes are not subject to anticipation effects.[586] This may be because the vast majority are changes based on judicial decisions, rather than statutory changes, as hypothesized by researchers.[587] Moreover, even if anticipation effects occur in studies of non-compete enforceability, that would likely not change the measurable observed benefits of reducing non-compete enforceability, and may indeed lead to underestimation of observed benefits. Underestimation would occur if parties were adjusting their behavior in advance of the change in enforceability in the same direction as the effects observed after the change. This would occur if, for example, firms began to decrease use of non-competes in advance of a decrease in non-compete enforceability, knowing that those non-competes would soon be less enforceable. This ultimately would mean that the actual effects on labor mobility, earnings, new business formation, innovation, and other outcomes could be even greater. Additionally, the legal change in Michigan is subject to other criticism, as discussed under ''Evidence of inhibited innovation'' and by commenters.

iii. Non-Competes May Increase Concentration and Consumer Prices

Evidence of Increased Concentration and Consumer Prices

As described in Parts IV.B.3.b.i and ii, the Commission finds that non-competes tend to negatively affect competitive conditions in product and service markets by inhibiting new business formation and innovation, and have in fact done so. The Commission finds that these effects, standing alone, are sufficient to support its finding that non-competes tend to negatively affect competitive conditions in product and service markets.

However, the Commission notes that there is also evidence that non-competes increase industrial concentration more broadly, which in turn tends to raise consumer prices. The empirical literature on these effects is less developed than the empirical work documenting declines in new business formation and innovation; specifically, the empirical evidence on consumer prices relates only to healthcare markets (though the evidence on concentration spans all industries in the economy). For this reason, the Commission does not rest its finding that non-competes tend to negatively affect competitive conditions in product and service markets on a finding that non-competes increase concentration and consumer prices. However, there are several reliable studies finding that non-competes increase concentration and/or consumer prices, bolstering the Commission's finding that non-competes tend to negatively affect competitive conditions in product and service markets.

The Commission finds that non-competes reduce new business formation.[588] By doing so, non-competes may increase concentration. Non-competes may also stunt the growth of existing firms that would otherwise better challenge dominant firms, for example, by limiting potential competitors' access to talented workers.[589]

Non-competes may also affect prices in a variety of ways. By suppressing workers' earnings, non-competes decrease firms' costs, which firms may theoretically pass through to consumers in the form of lower prices. However, non-competes may also have several countervailing effects that would tend to increase prices. First, non-competes may increase concentration, which could lead to less competition between firms on price, and therefore higher prices for consumers. Second, by inhibiting efficient matching between workers and firms, non-competes may reduce the productivity of a firm's workforce, which may lead to higher prices. Third, by inhibiting innovation, non-competes may hinder the development of lower-cost products or more efficient manufacturing processes.

One study, by Hausman and Lavetti, focuses on physician markets. The study finds that as the enforceability of non-competes increases, these markets become more concentrated, and prices for consumers for physician services increase. The study finds that while non-competes allow physician practices to allocate clients more efficiently across physicians, this comes at the cost of greater concentration and higher consumer prices. This study examines several changes in non-compete enforceability measured continuously. The authors note that, in theory, if decreased non-compete enforceability decreases earnings, then the fall in prices may simply be due to pass-through of labor costs. However, empirical research shows that decreased non-compete enforceability increases earnings (as discussed in Part IV.B.3.a.ii). Even if that were not the case, Hausman and Lavetti show that labor cost pass-through cannot explain their findings.[590] This study satisfies all of the principles described in Part IV.A.2, and is accordingly weighted highly by the Commission.

Another study, by Lipsitz and Tremblay, examines all industries in the economy and shows empirically that increased enforceability of non-competes at the State level increases concentration.[591] Lipsitz and Tremblay theorize that non-competes inhibit entrepreneurial ventures that could otherwise enhance competition in goods and service markets. The authors show that the potential for harm is greatest in the industries in which non-competes are likely to be used at the highest rate.[592]

If the general causal link governing the relationship between enforceability of non-competes, concentration, and consumer prices acts similarly to that identified in the study by Hausman and Lavetti, then it is plausible that increases in concentration identified by Lipsitz and Tremblay would lead to higher prices in a broader set of industries than healthcare. Lipsitz and Tremblay use several changes in non-compete enforceability measured in a continuous fashion, but do not measure the impact on consumer prices or welfare. The Commission therefore finds the study's conclusion that non-competes increase concentration highly robust, but the study is not itself direct empirical evidence of a relationship between non-competes and prices.

Two additional studies assess the effects of non-competes on concentration and prices. However, the Commission gives these studies little weight.

A study of physician non-competes by Lavetti, Simon, and White finds that prices charged by physicians with non-competes are similar to those charged by physicians without non-competes.[593]

[593] *See* Lavetti, Simon, & White, *supra* note 82.

The Commission gives this study less weight because it merely analyzes differences between workers based on the use of non-competes.[594]

A study by Younge, Tong, and Fleming finds that non-competes contribute to economic concentration because non-compete enforceability increases the rate of mergers and acquisitions.[595] This study uses one change in non-compete enforceability—in Michigan—to generate its results. However, in addition to its use of a single legal change in a single State, the change to non-compete enforceability was accompanied by several other changes to Michigan's antitrust laws, so it is not possible to identify the effect of the change in non-compete enforceability standing alone.

Comments Pertaining to Increased Concentration and Consumer Prices and the Commission's Responses

Several commenters addressed the question of whether non-competes affect concentration and consumer prices. Some commenters asserted that the rule would lower consumer prices by improving matches between employers and workers, increasing productivity. Commenters also argued that locking up talent, particularly in specialized markets, prevents entrepreneurship and new business formation and can thus contribute to increased concentration.

Some commenters opposing the NPRM claimed that banning non-competes could increase concentration. These commenters argued that larger firms could discourage companies from expanding into new and underserved markets by poaching, or threatening to poach, their key employees, leading to increased costs that could force some firms out of business. These commenters also argued that non-competes protect small businesses from dominant consolidators, as high recruitment, retention, and other costs may induce small businesses to sell or larger businesses may hire away their workers. A medical trade organization stated that without non-competes, independent practices might not be able to afford to hire and thus may be unable to grow or compete.[596]

While these commenters theorize that prohibiting non-competes would increase concentration, the Commission notes that the available evidence indicates that non-competes increase concentration, rather than reducing it. The Commission further notes that these theories are inconsistent with the robust empirical literature finding that non-competes reduce new business formation, as well as with the hundreds of comments from small businesses, including physician practices, recounting how non-competes stymied their ability to enter markets or grow because they make it harder to hire talent.

Several commenters claimed that prohibiting non-competes would increase worker earnings and increase transaction costs related to hiring, which firms would pass through to consumers in the form of higher prices. However, the only study of how non-competes affect prices—the Hausman and Lavetti study—finds that decreased non-compete enforceability *decreases* prices in the healthcare market, rather than increasing them. Moreover, while it is theoretically possible that higher labor costs could be passed on to consumers in the form of higher prices, there are several countervailing effects from prohibiting non-competes that would tend to lower prices. Additionally, empirical research shows that labor cost pass-through cannot explain decreases in prices in healthcare markets associated with non-competes becoming less enforceable.[597]

An insurance company stated that insurance premiums would increase if the rule allows non-profit hospitals to dominate the hospital market and have more leverage in network negotiations. These commenters do not provide any empirical evidence to support this assertion. Moreover, for the reasons described in Part V.D.5, the Commission disagrees that the ability to use non-competes will provide a material competitive advantage to non-profit hospitals. Another commenter stated that if non-competes are prohibited, physicians will leave States with lower market reimbursement rates for those with higher rates, increasing healthcare costs and shortages. Commenters did not cite any empirical evidence that supports this hypothetical assertion that the final rule would increase healthcare costs or shortages due to physicians leaving States with lower reimbursement rates, and the Commission is aware of none. However, the Commission notes that it received many comments from doctors, nurses, and other healthcare professionals asserting that non-competes worsen healthcare shortages.[598]

Some commenters stated that non-competes may improve access to physicians due to non-compete-led consolidation or more efficient patient-sharing within practices, and that Hausman and Lavetti's study is unable to quantify these benefits. In response, the Commission notes that there is no empirical literature bearing out this theory, and that the commenters overwhelmingly stated that non-competes decrease patients' access to the physicians of their choice, increase healthcare shortages, and negatively affect the quality of health care.[599]

iv. Non-Competes May Reduce Product and Service Quality and Consumer Choice

The negative effects of non-competes on competition may also degrade product and service quality and consumer choice. Competition encourages firms to expand their product offerings and innovate in ways that lead to new and better products and services.[600] However, by inhibiting new business formation, increasing concentration, and reducing innovation, non-competes reduce competitive pressure in product and service markets, which may reduce product quality and consumer choice. In addition, poor working conditions and less optimal matching of workers and firms may lead to reductions in the quality of products and services. For these reasons, non-competes may tend to negatively affect competitive conditions in product and service markets by reducing product quality and consumers' options.

Such effects are less readily quantifiable than the other negative effects of non-competes on product and service markets—*i.e.,* the negative effects on new business formation, innovation, concentration, and consumer prices. It is thus unsurprising that there are not reliable empirical studies of these effects. However, the Commission received an outpouring of public comments on this issue. Hundreds of commenters, primarily from the healthcare field, described how

[594] *See* Part IV.A.2 (describing the shortcomings of such studies).

[596] *See also* Part XI.C.2, which addresses these types of comments in greater detail.

[597] Hausman & Lavetti, *supra* note 590.

[598] These comments are summarized in greater detail in Part IV.B.3.b.iv.

[599] *See* Part IV.B.3.b.iv.

[600] In the NPRM, the Commission noted that innovation and entrepreneurship can, in turn, have positive effects on product quality. *See* NPRM at 3492. The Commission did not make specific findings on the effect of non-competes on consumer choice. However, the Commission discussed the closely related questions of how non-competes affect new business formation, innovation, concentration, and consumer prices. *See id.* at 3490–93.

non-competes reduce product and service quality and consumer choice.

The large number of comments the Commission received on this issue, the wide variety of impacts commenters describe, and the fact that the impacts commenters describe are overwhelmingly negative, indicate that non-competes reduce product quality and consumer choice, further bolstering the Commission's finding that non-competes tend to negatively affect competitive conditions in product and service markets.[601]

The commenters who addressed the effects of non-competes on product quality and consumer choice primarily discussed the healthcare industry. The majority of these comments focused on how non-competes harm patient care. Hundreds of physicians and other commenters in the healthcare industry stated that non-competes negatively affect physicians' ability to provide quality care and limit patient access to care, including emergency care. Many of these commenters stated that non-competes restrict physicians from leaving practices and increase the risk of retaliation if physicians object to the practices' operations, poor care or services, workload demands, or corporate interference with their clinical judgment. Other commenters from the healthcare industry said that, like other industries, non-competes bar competitors from the market and prevent providers from moving to or starting competing firms, thus limiting access to care and patient choice. Physicians and physician organizations said non-competes contribute to burnout and job dissatisfaction, and said burnout negatively impacts patient care.

In addition, physicians and physician organizations stated that, to escape non-competes, physicians often leave the area, and that this severs many physician/patient relationships. These commenters stated that non-competes therefore cause patients to lose the knowledge, trust, and compatibility that comes with long-established relationships. These commenters also said that strong physician/patient relationships and continuity of care improve health outcomes, particularly for complex, chronic conditions or patients who need multiple surgeries. These commenters described how patients who lose their physicians to non-competes either travel long distances to see that physician, switch physicians, or lose access entirely if no other physicians are available. One physician argued that taking away a patient's ability to choose their provider violates the Patients' Bill of Rights.[602]

One medical society cited a 2022 survey of Louisiana surgeons in which 64.4% of the surgeons believed non-competes force patients to drive long distances to maintain continuity of care, and 76.7% believed they force surgeons to abandon their patients if they seek new employment.[603] This study had a small sample size and thus the Commission gives it limited weight, but the Commission notes that it accords with the many comments the Commission received describing how patients must drive long distances to maintain continuity of care—or are unable to do so, resulting in harms to their health. Illustrative comments on how non-competes affect the quality of patient care include the following:

- As a primary care physician I truly hope to see [the rule] move forward. I recently left my position at one company and for a year commuted an hour to be outside of my non-compete radius. I recently returned to my community and discovered I have more patients than I can count who simply didn't get care for over a year because they didn't want to find a new [primary care physician] but also couldn't make the hour drive to see me at my new location. The commute was annoying for me, but ultimately the only ones truly hurt were patients. Let's stop hurting our patients by restricting their ability to see their physicians.[604]
- My practice has operated since the 1990s in Danville, Kentucky. We are the only cardiology practice that has been present and has worked tirelessly to serve this rural community. The practice was a private practice originally. Unfortunately, just as most cardiac practices throughout the country have had to, our practice had to come under the control of these hospital systems to maintain its viability. . . . The CEO and the administration . . . have squeezed us out and forced us to leave the area with the employment contract non-compete in place. . . . I have spent the last 6 months hugging patients, medical staff, nursing who are stricken by the fact that we are being pushed out. Patients desperately ask me how they can maintain care if they have to travel up to an hour to see their doctors with this change. They worry how they can pay for the steep gas prices to see their doctors. . . . They are truly concerned for the health of their families. All the while all I can do is tell them that my non-compete does not allow me, their cardiologist for the past decade, to give them any advice on how to maintain their care.[605]
- As a Physician, I had a non compete clause in my contract that extended two counties wide (100 square miles). . . . [W]hen I would not sign a contract amendment regarding pay that was very unfavorable and nebulous I was called in and summarily dismissed 'no cause.' Because of that I had to work out of state and my patients were instantly without a physician. The community did not have enough physicians to be able to care for the patients who now had no medical provider. During COVID this lack of access to healthcare for patients most certainly led to increased unnecessary illness and death. . . . Patients are suffering with access to healthcare, and physician shortages are being exacerbated because every time a physician has to leave because of a non compete clause they start hiring and credentialing all over again and it can take months for them to be able to work again.[606]
- Being a therapist, non-competes are extremely scary when it comes to patient care. Some include date ranges in which we cannot communicate with our patients, some of whom have severe trauma histories or suicidal ideations. If a clinician changes companies but is unable to continue meeting a patient, who is at fault if there is an injury or death? . . . Some non-competes include mileage in which a clinician cannot create their own company or rent out an office within a certain radius—how is this a safe practice? How can clients continue to work on their mental health and desire to stay alive if they have to change clinicians due to a noncompete clause?[607]
- Due to mistreatment and to escape workplace toxicity, one of my colleagues left our practice in compliance to our non-compete conditions, even though they caused great hardship. I, too, wanted to leave, but could not because doing so would have harmed my family's well being. What I witnessed in the aftermath was unconscionable. There was a void in patient care and months later, there still is a void. Not only was this physician required to move quite a distance from the practice, he was forbidden to even inform his patients that he was leaving. The practice in turn, did not inform the patients, and when asked, just informed them that he was no longer with the practice. Consequently, wait times to treat cancers doubled and now have tripled.[608]
- I would like to open a new clinic in my town, but my noncompete would disallow that from happening immediately. Furthermore, I worry that my patients that need medical care wouldn't be able to access it at my current clinic because the providers

[601] As described in Parts IV.B.3.b.i and ii, the Commission finds that the effects of non-competes on new business formation and innovation, standing alone, are sufficient to sustain its finding that non-competes tend to negatively affect competitive conditions in product and service markets.

[608] Individual commenter, FTC–2023–0007–2384.

are booked out 6+ months, and if one left that would make those immediately increase to nearly a year, which could potentially cause my patient lasting damage. If I could open my own clinic locally without the constraints of the noncompete, those patients would be able to continue care as necessary with me, and I wouldn't feel stuck with poor management worsening patient care for my patients.[609]

- As a veterinarian, I can personally assure the FTC that such restrictions have caused both death and permanent disability of pets. . . . In nearly every scenario I have heard of, the veterinary business that requires and enforces non-compete clauses is underserving the pet-owning public. This is the current situation for veterinary medicine on a national level. Hospitals are so overwhelmed that they are not accepting new patients, turning away emergency cases, and imposing extremely long (several months or more) waiting lists for appointments and/or scheduled procedures. If a hospital cannot accommodate the patients who require veterinary care, that hospital is not able to compete with the existing demand for services. . . . Is it fair for pet owners who cannot get their pets in to see a veterinarian (even on emergency situations) to have the veterinary hospitals who refuse to see their pets remove other options for care via non-compete clauses? These clauses are being blatantly abused by certain large veterinary businesses so that these organizations can maintain a pool of potential patients (on waiting lists) to draw from. Unfortunately, many of these dogs and cats die while waiting to be seen. At least in my profession, the non-compete concept has reached an epitome of unethical conduct. In addition, economic growth has been stunted due to self-serving greedy people in power. Please get rid of this horrible clause and lets make sure pets and their owners get what they need, when they need it.[610]

Some hospital associations argued that a study of physician markets[611] shows that non-competes improve patient care. According to these commenters, this research finds that non-competes make in-practice referrals more likely, increasing revenue and wages and providing patients with more integrated and better care. In response, the Commission notes that while the study finds that non-competes make physicians more likely to refer patients to other physicians within their practice—increasing revenue for the practice—it makes no findings on the impact on the quality of patient care. The Commission further notes that pecuniary benefits to a firm cannot justify an unfair method of competition.[612]

Some medical practices argued that within-group referrals allow physicians to coordinate care plans and simplify logistics, and that non-competes protect the stability of those care teams to patients' benefit. Some industry associations and hospitals argued that non-competes improve patient choice and continuity of care because they stop physicians from leaving a health provider, benefiting patients who cannot follow the provider due to geographic or insurance limitations. One physician association said physicians leaving jobs can be costly to patients, who must transfer records and reevaluate insurance coverage.

The Commission notes that the vast majority of comments from physicians and other stakeholders in the healthcare industry assert that non-competes result in worse patient care. The Commission further notes that the American Medical Association discourages the use of non-competes because they ''can disrupt continuity of care, and may limit access to care.'' [613] In addition, there are alternatives for improving patient choice and quality of care, and for retaining physicians, that burden competition to a much less significant degree than non-competes.

A related issue frequently raised in the comments is the impact non-competes have on healthcare shortages. According to many commenters, non-competes contribute to shortages by preventing physicians from moving to areas where their skills and specialties are needed; forcing physicians out of such areas; or forcing them out of practice entirely due to contractual restrictions or burnout. Such shortages, according to these commenters, decrease access to care, increase wait times, lead to canceled procedures, and decrease the quality of care. Many commenters stated that these effects of non-competes are particularly acute in rural, underserved, and less affluent areas that already have difficulty attracting healthcare professionals. Some commenters argued that provider shortages can, in combination with non-competes, create monopolies.

A smaller number of commenters from the healthcare industry argued that non-competes alleviate healthcare shortages and prevent hospital or facility closures by keeping physicians from leaving underserved areas and reducing fluctuations in labor costs. Some of these commenters asserted that a ban on non-competes would upend healthcare labor markets, thereby exacerbating healthcare workforce shortages, especially in rural and underserved areas. A medical society argued that non-competes can allow groups to meet contractual obligations to hospitals, as physicians leaving can prevent the group from ensuring safe care. As the Commission notes, there are not reliable empirical studies of these effects, and these commenters do not provide any. However, the Commission notes that the rule will increase labor mobility generally, which makes it easier for firms to hire qualified workers.

Commenters in a variety of industries beyond healthcare markets also provided a wide range of examples of how non-competes diminish the quality of goods and services, including preventing businesses from hiring experienced staff and creating worker shortages. Commenters stated that, where firms in a market use non-competes, it can be difficult for other firms to remain in the market, and consumers thus lose the freedom to choose providers. Several comments pointed favorably to the American Bar Association's longstanding ban on non-competes for most lawyers to protect clients' freedom to choose their lawyer, in contrast with other highly paid and highly skilled professions such as physicians and their patients or clients.[614]

Commenters from outside the healthcare industry mainly focused on how non-competes increase concentration within industries, which reduces firms' incentive to innovate and results in consumers having fewer choices. Other commenters described how non-competes lock highly talented workers out of their fields or force them into jobs where they are less productive, depriving the marketplace of the products and services they would have developed. Illustrative examples of these comments include the following:

- As a software developer who often works under contracts containing sections stipulating non-compete agreements, I have observed first hand how they can harm the economy by bolstering monopolies, such as in sectors where clientele only have a single choice for meeting their engineering needs. Often, these clients have no other options and are forced to meet whatever arbitrary price point is set by the leading (sole)

[609] Individual commenter, FTC–2023–0007–1206.

company, and that company may in turn operate howsoever they choose without feeling the need to adopt reasonable business practices that might exist were there competition.[615]

- As an aspiring tree care professional, non-compete agreements prevent me from switching employers/companies to access better work conditions or opportunities. No tree service company has ever invested in me. I learned to climb and saw while working for Federal agencies (USDA and NPS), and also through self-education and practice on my own. I believe that non-compete agreements have adversely limited competition in the tree service industry. This hurts employees who could do better if they were free to change their place of employment, and it hurts consumers who have fewer tree service providers to choose from.[616]
- I worked in a business supplying technology and materiel considered critical for national defense. I was labeled an expert in the field by my DoD customers and commended multiple times for solving logistical and technical problems with protective equipment during the previous two wars. I lead development contracts from the DoD to advance the state-of-the-art in warfighter protection, which set multiple records for figures of merit within my business, and which our program manager volunteered was the most exciting technology she had ever managed. When my business decided to discontinue that technology and transfer me, my noncompete agreement prevented me from continuing to support the DoD. I was removed from consideration at another firm in the third round of interviews because of my noncompete agreement—again, for a technology my business had decided to not pursue and had transferred me out of. So, instead of having the opportunity to advance my career into management in the service of protecting warfighters, I had to exit that industry and move laterally, into a different industry that cannot value 20 years of my expertise, and which will not further the defense of my country. If the FTC had nationalized a prohibition on noncompete clauses two years ago, this would not have happened, and I would have had the opportunity to advance my career, improve my family's economic fortune, and continue to contribute to our nation's defense.[617]

Overall, the Commission believes that the large number of comments it received on the issue of product quality and consumer choice and the wide variety of overwhelmingly negative impacts commenters describe further bolsters the Commission's finding that non-competes tend to negatively affect competitive conditions in product and service markets.

4. Prohibitions in Section 910.2(a)(1)

Based on the totality of the evidence, including its review of the empirical literature, its review of the full comment record, and its expertise in identifying practices that harm competition, the Commission adopts § 910.2(a)(1), which defines unfair methods of competition related to non-competes with respect to workers other than senior executives. Section 910.2(a)(1) provides that, with respect to a worker other than a senior executive, it is an unfair method of competition for a person to enter into or attempt to enter into a non-compete clause; enforce or attempt to enforce a non-compete clause; or represent that the worker is subject to a non-compete clause.

Part IV.A sets forth the Commission's determination that the foregoing practices are unfair methods of competition under section 5, and Parts IV.B.1 through IV.B.3 explain the findings that provide the basis for this determination. In this Part IV.B.4, the Commission explains the three prongs of § 910.2(a)(1) and addresses comments on proposed § 910.2(a).[618]

a. Entering Into or Attempting To Enter Into (§ 910.2(a)(1)(i))

Proposed § 910.2(a) would have provided that it is an unfair method of competition for an employer to, among other things, ''enter into or attempt to enter into a non-compete clause with a worker.'' The Commission adopts this same language in the final rule in § 910.2(a)(1)(i). As a result, the final rule prohibits persons from entering into or attempting to enter into non-competes with workers other than senior executives as of the effective date. (Section 910.2(a)(2)(i) separately prohibits persons from entering into or attempting to enter into non-competes with senior executives as of the effective date.)

A business commenter requested that the Commission remove ''attempt to enter into'' from § 910.2(a) on the basis that it may encourage workers to sue employers for contractual provisions that have no practical effect on the worker or which are not finalized in any employment agreement. The Commission disagrees that conduct that would be covered by the attempt provision—such as presenting the worker with a non-compete, even if the employer and worker do not ultimately execute the non-compete—has no practical effect on the worker. The Commission is concerned that such attempts to enter into non-competes still have *in terrorem* effects that deter competition. For example, workers presented with non-competes may not realize they are not bound by them. Such workers may therefore refrain from seeking or accepting other work or starting a business, yielding the same tendency of non-competes to negatively affect competitive conditions that motivate this final rule.

The Commission accordingly finalizes the language as proposed.

b. Enforcing or Attempting To Enforce (§ 910.2(a)(1)(ii))

Proposed § 910.2(a) would have provided that it is an unfair method of competition for an employer to, among other things, ''maintain with a worker a non-compete clause.'' In addition, proposed § 910.2(b)(1) would have provided that, to comply with this prohibition on maintaining a non-compete, an employer that entered into a non-compete with a worker prior to the compliance date must ''rescind the non-compete no later than the compliance date.''

As elaborated in Part IV.E, the Commission has decided not to finalize a rescission requirement. As a result, the Commission also removes ''maintain'' from the text of § 910.2(a), to avoid any ambiguity about whether the final rule contains a rescission requirement. Instead of a rescission requirement, the final rule focuses more narrowly on the future enforcement of existing non-competes with workers other than senior executives. It provides that, with respect to a worker other than a senior executive, it is an unfair method of competition for a person to enforce or attempt to enforce a non-compete clause. An employer attempts to enforce a non-compete where, for example, it takes steps toward initiating legal action to enforce the non-compete, even if the court does not enter a final order enforcing the non-compete.

For workers other than senior executives, this prohibition on enforcing a non-compete applies to all non-competes, but affects only enforcement or attempted enforcement conduct taken after the effective date of the rule. In so doing, the Commission reduces the burden on employers by eliminating the need to take steps to formally rescind provisions of existing contracts, instead simply requiring that employers refrain from enforcing or attempting to enforce in the future (after the effective date) non-competes that are rendered unenforceable by this provision of the rule.

As explained in Part IV.C, the Commission in the final rule does not prohibit the future enforcement or attempted enforcement of existing non-

competes with senior executives. The Commission considered whether to take this approach for workers other than senior executives, but based on the totality of the evidentiary record concludes that such non-competes should not remain in force after the effective date for three main reasons. First, existing non-competes with workers other than senior executives negatively affect competitive conditions to a significant degree, for the same reasons as new non-competes. The Commission believes that non-competes with such workers that were entered into before the effective date implicate the concerns described in Part IV.B.3—relating to the negative effects of non-competes on competitive conditions in labor, product, or service markets—to the same degree as non-competes entered into as of the effective date. Of course, the Commission notes that the empirical evidence quantifying the harms to competition from non-competes by definition relates to existing non-competes.

Second, for workers other than senior executives, existing non-competes not only impose acute, ongoing harms to competition, they also impose such harms on individual workers by restricting them from engaging in competitive activity by seeking or accepting work or starting their own business after their employment ends. As described in Part IV.B.2.b, the Commission received thousands of comments from workers that described non-competes as pernicious forces in their lives that forced them to make choices that were detrimental to their finances, their careers, and their families. These concerns are less present for senior executives, who are far more likely than other workers to have negotiated their non-compete and received compensation in return, thereby mitigating this kind of acute, ongoing harm.

Third, because the Commission finds that non-competes with workers other than senior executives generally are not bargained for and such workers generally do not receive meaningful, if any, compensation for non-competes, the practical considerations that are present with respect to existing non-competes for senior executives (discussed in Part IV.C.3) are far less likely to be present for other workers. For these reasons, the Commission concludes that, consistent with the proposed rule, existing non-competes with workers other than senior executives should not remain in force after the effective date.

Several commenters argued that the Commission should allow all existing non-competes to remain in effect. Some of these commenters argued that the rule would upset bargained-for agreements. Commenters asserted that workers who received benefits in exchange for agreeing to non-competes would receive a windfall if such clauses cannot be maintained and are no longer enforceable. A few of these commenters also argued that invalidating existing non-compete agreements will upset workers' economic interests because they will lose out on enhanced compensation that they have received or expect to receive in exchange for their non-competes. Some commenters contended that invalidating existing non-competes would be especially harmful to workers' interests in non-competes tied to particularly large amounts of compensation, complex compensation arrangements, or unique forms of compensation such as equity grants. Relatedly, some commenters expressed concern that the NPRM did not explain whether employers could recoup benefits already paid in exchange for non-competes. A few commenters suggested that they have given workers confidential and trade secret information in exchange for the worker agreeing to a non-compete that may no longer be enforceable.

The Commission is not persuaded by comments arguing that the rule would upset existing bargained-for agreements. As noted in Part IV.B and Part IV.C, the Commission finds that workers who are not senior executives are unlikely to negotiate non-competes or to receive compensation for them. Moreover, the Commission has also determined that non-competes with senior executives that predate the effective date may be enforced,[619] which will substantially reduce the number of workers with complex compensation arrangements whose non-competes are rendered unenforceable after the effective date.

Other commenters argued that employers relied on the expectation of a non-compete when deciding how much to invest in training their workers or the extent to which they share trade secrets with their workers. In response, the Commission notes that firms that are concerned about retention have tools other than non-competes for retaining workers, including fixed-duration employment contracts (*i.e.,* forgoing at-will employment and instead making a mutual contractual commitment to a period of employment) and providing improved pay and benefits (*i.e.,* competing on the merits to retain the worker's labor services). In addition, while some workers that have received training may leave a firm for a competitor, firms will also be able to attract highly trained workers *from* competitors, and this increased job-switching will likely lead to more efficient matching between workers and employers overall.[620]

The Commission is not persuaded by commenters who contended that invalidating existing non-competes would disturb employer expectations with respect to sharing trade secrets or other commercially sensitive information. As explained in Part IV.D.2, the Commission finds that employers have adequate alternatives to non-competes to protect these interests, including trade secret law and NDAs, and that these alternatives do not impose the same burden on competition as non-competes. Some commenters contended that employers may not have adequate alternatives in place for existing non-competes and that former workers may not agree to new NDAs. But the Commission finds that it is rare for an employer who entered into a non-compete agreement as a means of protecting trade secrets or commercially sensitive information to have not also entered into an NDA with the worker.[621] This is especially true given that non-competes are generally less enforceable than NDAs.[622] In any event, nothing in the final rule prevents employers from entering new NDAs with workers.

Some commenters contended that invalidating existing non-competes would enable new employers to ''free ride'' off former employers' investments in training. The Commission addresses comments about ''free riding'' and training investments in Part IV.D.2.

Several comments argued that a final rule should not invalidate existing non-competes because the economic impact is too unpredictable. These commenters maintained that the number of individual employment contracts that would be invalidated means that the economic impact would be exceptionally widespread, and likely impossible to accurately predict. In response, the Commission notes that it

J. 669, 676 (2024) (''Courts across jurisdictions routinely give confidentiality agreements 'more favorable treatment' than noncompetes. And confidentiality agreements are not typically subject to the same limitations that are applied to noncompetes. . . . Overall, courts tend to apply a default rule of enforceability.'') (internal citations omitted).

has assessed the benefits and costs of the final rule and finds that the final rule has substantial benefits that clearly justify the costs (even in the absence of full monetization).[623]

c. Representing (§ 910.2(a)(1)(iii))

Proposed § 910.2(a) would have provided that it is an unfair method of competition for an employer to, among other things, ''represent to a worker that the worker is subject to a non-compete clause where the employer has no good faith basis to believe that the worker is subject to an enforceable non-compete clause.'' The Commission adopts the same language in the final rule. Pursuant to § 910.2(a)(1)(iii), it is an unfair method of competition for an employer to represent that a worker other than a senior executive is subject to a non-compete clause. The ''good faith'' language remains in the final rule but, for clarity, it has been moved to § 910.3, which contains exceptions to the final rule.[624]

Under this ''representation'' prong, the final rule prohibits an employer from, among other things, threatening to enforce a non-compete against the worker; advising the worker that, due to a non-compete, they should not pursue a particular job opportunity; or telling the worker that the worker is subject to a non-compete. The Commission believes that this prohibition on representation is important because workers often lack knowledge of whether employers may enforce non-competes.[625] In addition, the evidence indicates that employers frequently use non-competes even when they are unenforceable under State law, suggesting that employers may believe workers are unaware of or unable to vindicate their legal rights.[626] Employers can exploit the fact that many workers lack knowledge of whether non-competes are unenforceable under State law by representing to workers that they are subject to a non-compete when they are not or when the non-compete is unenforceable. Such misrepresentations can have *in terrorem* effects on workers, causing them to refrain from looking for work or taking another job, thereby furthering the adverse effects on competition that the Commission is concerned about.

In addition, threats to litigate against a worker—even where the worker is aware of the Commission's rule and believes the non-compete is unenforceable—may deter the worker from seeking or accepting work or starting their own business. As explained in Part IV.B.2.b.ii, many commenters—including highly paid workers—explained in their comments that they believed their non-compete was unenforceable, but they nevertheless refrained from seeking or accepting work or starting their own business because they could not afford to litigate against their employer for any length of time. For this reason, the Commission believes it is important for the final rule to prohibit employers not only from enforcing or attempting to enforce non-competes against workers other than senior executives, but also threatening to do so.

A commenter suggested limiting the ''representation'' prong to instances where the employer has no good-faith basis to believe the non-compete is valid ''under local or State law,'' even if the non-compete is invalid under the final rule. The Commission does not adopt this approach because representing to workers that they are subject to a non-compete, where the rule provides that the non-compete is unenforceable, would mislead the worker and would tend to deter them from competing against the employer by seeking or accepting work or starting a business.

C. Section 910.2(a)(2): Unfair Methods of Competition—Non-Competes With Senior Executives

In the NPRM, the Commission proposed to prohibit non-competes—including non-competes entered into before the effective date—with all workers.[627] The Commission preliminarily found that all non-competes, whether with senior executives or other workers, were restrictive conduct that negatively affected competitive conditions.[628] However, while the Commission preliminarily found that non-competes with workers other than senior executives were exploitative and coercive, the Commission stated that this finding did not apply to senior executives.[629] The Commission requested comment on that preliminary finding, as well as on whether non-competes with senior executives should be excluded from the rule or otherwise subject to a different standard. The NPRM did not define the term ''senior executive,'' but sought comment on potential approaches to defining the term.[630]

In the final rule, the Commission does not find that senior executives—specifically, highly paid workers with the highest levels of authority in an organization—are exploited or coerced in connection with non-competes, and it describes the record on this issue in Part IV.C.1. The Commission does, however, find that non-competes with senior executives are an unfair method of competition, based on the totality of the evidence, including its review of the empirical literature, its review of the full comment record, and its expertise in identifying practices that impair competitive conditions in the economy. Specifically, the Commission finds that such non-competes are restrictive and exclusionary conduct that tends to negatively affect competitive conditions in product and service markets and labor markets. Indeed, non-competes with senior executives may tend to negatively affect competitive conditions in product and service markets to an even greater degree than non-competes with other workers, given the outsized role senior executives play in forming new businesses and setting the strategic direction of firms with respect to innovation. The Commission explains the basis for these findings in Part IV.C.2.

Because non-competes with senior executives are not exploitative or coercive, however, this subset of workers is less likely to be subject to the kind of acute, ongoing harms currently being suffered by other workers subject to existing non-competes. In addition, commenters raised credible concerns about the practical impacts of extinguishing existing non-competes for senior executives. For these reasons, as described in Part IV.C.3, the Commission allows existing non-competes with senior executives to remain in force—unlike existing non-competes with all other workers, which employers may not enforce after the effective date.

In Part IV.C.4, the Commission explains the final rule's definition of ''senior executive'' and the related definitions it is adopting.[631] The Commission finds that the final rule's definition of ''senior executive'' appropriately captures the workers that are more likely to have complex compensation packages that present practical challenges to untangle, and who are less likely to be exploited or coerced in connection with their non-competes. To capture this subset of

workers for whom the Commission decides to leave existing non-competes unaffected, the final rule adopts a definition of senior executive that uses both an earnings test and a job duties test. Specifically, the final rule defines the term ''senior executive'' to refer to workers earning more than $151,164 who are in a ''policy-making position'' as defined in the final rule.[632]

Finally, in Part IV.C.5, the Commission explains the regulatory text it is adopting in § 910.2(a)(2), which defines unfair methods of competition related to non-competes with senior executives.

1. The Commission Does Not Find That Non-Competes With Senior Executives Are Exploitative or Coercive

The Commission stated in the NPRM that its preliminary finding that non-competes are exploitative and coercive did not apply to senior executives. The Commission stated that non-competes with senior executives are unlikely to be exploitative or coercive at the time of contracting, because senior executives are likely to negotiate the terms of their employment and may often do so with the assistance of counsel.[633] The Commission also stated that such non-competes are unlikely to be exploitative or coercive at the time of the executive's potential departure, because senior executives are likely to have bargained for a higher wage or more generous severance package in exchange for agreeing to the non-compete.[634] The Commission sought comment on whether there are other categories of highly paid or highly skilled workers (*i.e.,* other than senior executives) who are not exploited or coerced in connection with non-competes.[635]

Based on the totality of the record, including the many comments submitted on these questions, the Commission finds that senior executives—specifically, highly paid workers with the highest levels of authority in an organization—are substantially less likely than other workers to be exploited or coerced in connection with non-competes. For these reasons, the Commission does not find that non-competes with senior executives are exploitative or coercive.

There is little empirical evidence on the question of whether non-competes with senior executives are exploitative or coercive. A 2006 study of non-competes with CEOs finds that many of these workers negotiated a severance period as long or longer than their non-compete period, making it easier to sit out of the market.[636] However, this study was limited to very-high-earning CEOs at large public companies—the average total compensation of the CEOs studied was $1.65 million [637]—so its findings do not necessarily capture the experiences of other senior executives. Many Americans work in positions with ''senior executive'' classifications. According to BLS, there were almost 3.4 million ''top executives'' in the U.S. in 2022 at firms under private ownership, and the median income for these workers was $99,240.[638]

The comment record on whether senior executives experience exploitation and coercion in relation to their non-competes is mixed. Many commenters asserted that, because some senior executives negotiate their non-competes with the assistance of expert counsel, they are likely to have bargained for a higher wage or more generous severance package in exchange for agreeing to the non-compete, and thus their non-competes are not exploitative or coercive. Several commenters stated that senior executives frequently negotiate non-competes for valuable consideration and/or typically agree to non-competes only in exchange for compensation. Some senior executives said they were not exploited or coerced in connection with non-competes.[639] Several commenters agreed with the Commission's preliminary finding that senior executives often obtain the assistance of counsel with respect to non-competes. Some commenters stated that to the extent a non-compete is not exploitative or coercive at the time of contracting, it is also not exploitative or coercive at the time of departure. One CEO stated that non-competes should be permissible for senior executives when they are entered into in exchange for severance and when the senior executive leaves voluntarily.

The Commission notes that a relatively small number of self-identified senior executives submitted comments in their personal capacity. While the Commission did receive some comments from self-identified senior executives suggesting that their non-competes were exploitative and coercive, such comments were far less common than for other workers. However, some senior executives did report experiencing similar issues of exploitation and coercion. Several senior executives said that their non-competes were required and non-negotiable. Multiple senior executives described their own non-competes as ''one-sided'' in favor of the employer. Some senior executives said they were not given consideration for the non-compete, and even some who said they received consideration still said their non-competes were exploitative and coercive. For example, some senior executives said they: (1) were required to sign a non-compete under threat of losing their job or their earned compensation; (2) were forced into a stock share buyout that included a non-compete; or (3) could obtain long-term compensation only if they signed a non-compete. Two advocacy groups stated that many senior executives may lack power to avoid non-competes and that employers still hold most of the leverage in employment negotiations, even with respect to senior executives. An employment law firm stated that in its experience, it had not seen higher compensation for senior executives and other highly paid workers in jurisdictions where non-competes were allowed, and that employers rarely provide compensation for non-competes. The firm said that senior executives and other highly paid workers are more likely to receive severance payments, but such payments are paid only in some cases. It said that even when paid, the severance payments often do not fully compensate for what a senior executive could have otherwise earned during the non-compete period.

Furthermore, several self-identified senior executives said they felt unable to leave their company because of their non-competes. Many of these commenters said they feared being unemployed. Some senior executives said they feared or could not afford litigation, while two senior executives said that they could not afford to fight non-competes they believed were unenforceable. Several self-identified senior executives, having spent their careers in one industry, said they were forced to sit out of the market for long periods, forgoing earnings and the ability to work. Others reported struggling to find a job and suffering

financially, including living on Social Security or nearing bankruptcy.

One law firm specializing in executive compensation said many senior executives may have achieved top roles at companies because they have spent decades in the same industry and would struggle to find work with firms other than competitors. Another law firm said senior executives blocked from an industry could lose their long-cultivated reputation in the industry and, as a result, time out of an industry could harm their careers. Worker advocacy organizations and a law firm said senior executives tend to be relatively older and, as older workers are forced out of the job market, they are likely to be losing out on increasingly scarce employment opportunities relative to their younger counterparts. Another advocacy group argued that the Commission did not provide sufficient evidence to support its preliminary finding that non-competes are not exploitative and coercive for senior executives. A few commenters suggested that senior executives from historically marginalized groups may be paid less and have less bargaining power than other senior executives.[640]

Critically, the Commission received an outpouring of comments indicating that highly paid workers who are *not* senior executives (*i.e.,* who are not workers with the highest levels of authority in an organization) are often coerced or exploited via non-competes. The Commission received many comments from workers in relatively higher-wage fields—such as medicine, engineering, finance and insurance, and technology—who stated that employers exploited and coerced them through the use of non-competes.[641] The vast majority of higher-wage workers who are not senior executives reported that they lacked bargaining power in relation to their employer; did not negotiate their non-compete or receive compensation for it; and/or were not informed of the non-compete until after they received the job offer. Many of these workers stated that their non-compete was hidden or obscured; that their employers misled them about the terms of a non-compete; and/or that the non-compete was confusingly worded or vague. In addition, many high-wage workers recounted how non-competes coerced them into refraining from competing against their employer by forcing them to stay in jobs they wanted to leave or forcing them to leave their profession, move their families far away, and/or commute long distances. And a large share of high-wage workers argued that even where their non-competes were overbroad and likely unenforceable, they were deterred from seeking or accepting other work or starting a business by the threat of a lawsuit from their employer, which they said would be ruinous to their finances and professional reputations.[642] The Commission accordingly finds that higher-wage workers who are not senior executives are often exploited and coerced through employers' use of non-competes.

In addition, the Commission believes it is appropriate to conclude that lower-earning workers, regardless of their job title or function in an organization, are more likely to be exploited or coerced in connection with non-competes. As noted, many workers classified as ''top executives'' make under $100,000. Commenters did not self-report their income, so the Commission cannot definitively determine that the self-identified senior executives who reported exploitation and coercion are lower-wage senior executives. Because of their incomes, however, lower-wage senior executives are likely subject to many of the same exploitative and coercive factors that affect other workers, such as the inability to afford a non-compete lawsuit, forgo work for a lengthy period, leave the field, or relocate.[643] Comments from some senior executives confirmed that they did not have sufficient bargaining power to negotiate the non-compete or consideration for it, suffered serious financial harm from non-competes, and could not afford to litigate their non-competes. Accordingly, the Commission finds that a mere job title alone is insufficient to confer bargaining power on a worker, and lower-wage senior executives can be subject to the same exploitation and coercion that other workers face.

However, having considered the comments and the available empirical evidence on this question, the Commission does not find that non-competes with highly paid workers who are also senior executives are likely to be exploitative or coercive. The Commission stresses that it is not affirmatively finding that such non-competes can never be exploitative or coercive. The Commission has simply determined the record before it is insufficient to support such a finding at this time.

2. The Use of Non-Competes With Senior Executives is an Unfair Method of Competition Under Section 5

While the Commission does not find that non-competes with senior executives are exploitative and coercive, the Commission determines that these non-competes are nonetheless unfair methods of competition, for the reasons described herein.

To determine whether conduct is an unfair method of competition under section 5, the Commission assesses two elements: (1) whether the conduct is a method of competition, as opposed to a condition of the marketplace and (2) whether it is unfair, meaning that it goes beyond competition on the merits. The latter inquiry has two components: (a) whether the conduct has indicia of unfairness and (b) whether the conduct tends to negatively affect competitive conditions. These two components are weighed according to a sliding scale.[644]

Non-competes with senior executives satisfy all the elements of the section 5 inquiry. As described in Part IV.C.2.a, these non-competes are methods of competition. As described in Part IV.C.2.b, these non-competes are facially unfair conduct because they are restrictive and exclusionary. And as described in Part IV.C.2.c, these non-competes tend to negatively affect competitive conditions in product and service markets and in labor markets. Because the Commission finds that non-competes with senior executives are unfair methods of competition, the Commission declines to exclude them from the final rule. However, as described in Part IV.C.3, the final rule allows existing non-competes with senior executives to remain in effect, due to the considerations described therein.

[640] One of those commenters cited two *USA Today* articles that examined Federal workforce records for 88 companies in the S&P 100 to assess the number of Asian and Latina women in executive positions. The articles did not include the underlying data used for the evaluation. *See* Jessica Guynn & Jayme Fraser, *Asian Women Are Shut Out of Leadership at America's Top Companies. Our Data Shows Why,* USA Today (Apr. 25, 2022), *https://www.usatoday.//money/2022/04/25/asian-women-executives-discrimination-us-companies/7308310001/?gnt-cfr=1;* Jessica Guynn & Jayme Fraser, *Only Two Latinas Have Been CEOs at a Fortune 500 Company: Why So Few Hispanics Make It to the Top,* USA Today (Aug. 2, 2022), *https://www.usatoday.com/story/money/2022/08/02/hispanic-latina-business-demographics-executive//?gnt-cfr=1.* These news reports find a disparity in the number of Asian and Latina women in senior executive roles at these companies but make no specific findings on bargaining power. While lack of representation and other factors may impact bargaining power, the Commission believes that these two articles (with no underlying data provided) are insufficient evidence at this time to find exploitation and coercion with respect to this subset of senior executives.

a. The Commission Finds That Non-Competes With Senior Executives are a Method of Competition, Not a Condition of the Marketplace

With respect to the first element—whether conduct is a method of competition—the Commission finds that non-competes with senior executives are a method of competition for the same reasons as non-competes with other workers.[645]

b. Non-Competes With Senior Executives are Facially Unfair Conduct Because They are Restrictive and Exclusionary

In Part IV.B.2.a, the Commission finds that non-competes with workers other than senior executives are facially unfair conduct because they are restrictive and exclusionary. The Commission finds that non-competes with senior executives are facially unfair conduct for the same reasons.

Like non-competes for all other workers, the restrictive nature of non-competes with senior executives is evident from their name and function: non-competes restrict competitive activity. They prevent senior executives from seeking or accepting other work or starting a business after leaving their job. And like non-competes for all other workers, non-competes with senior executives are exclusionary because they impair the opportunities of rivals. Where a worker is subject to a non-compete, the ability of a rival firm to hire that worker is impaired. In addition, where many workers in a market are subject to non-competes, the ability of firms to expand into that market, or entrepreneurs to start new businesses in that market, is impaired. While non-competes may impair the opportunities of rivals in all labor markets, non-competes for senior executives are especially pernicious in this regard. Senior executives are relatively few in number, are bound by non-competes at high rates,[646] and have highly specialized knowledge and skills. Therefore, it can be extremely difficult for existing firms and potential new entrants to hire executive talent and to form the most productive matches.

Because senior executives are often compensated in return for their promise not to compete, some commenters argue that non-competes with senior executives are not unfair methods of competition. However, agreements can present concerns under the antitrust laws even when both parties benefit. Here, non-competes with senior executives are not unfair methods of competition under section 5 because they are unfair to the individual executive, but because they tend to negatively impact competitive conditions—*i.e.,* harm competition in product and service markets, as well as in labor markets—by imposing serious negative externalities on other workers, rivals, and consumers.[647]

c. Non-Competes With Senior Executives Tend To Negatively Affect Competitive Conditions

The Commission finds non-competes with senior executives tend to negatively affect competitive conditions in product and service markets and in labor markets. As explained in Part II.F, the legal standard for an unfair method of competition under section 5 requires only a tendency to negatively affect competitive conditions. The inquiry does not turn on whether the conduct directly caused actual harm in a specific instance. Here, the tendency of non-competes to impair competition is obvious from their nature and function, as it is for non-competes with workers who are not senior executives. And even if this tendency were not facially obvious, the evidence confirms that non-competes with senior executives do in fact negatively affect competitive conditions.

i. Non-Competes With Senior Executives Tend To Negatively Affect Competitive Conditions in Product and Service Markets

In the NPRM, the Commission stated that non-competes with senior executives may harm competition in product and service markets in unique ways.[648] The Commission stated that non-competes with senior executives may contribute more to negative effects on new business formation and innovation than non-competes with other workers, to the extent that senior executives may be likely to start competing businesses, be hired by potential entrants or competitors, or develop innovative products and services.[649] The Commission also stated that non-competes with senior executives may also block potential entrants, or raise their costs, to a high degree, because such workers are likely to be in high demand by potential entrants.[650] The Commission preliminarily concluded that, as a result, prohibiting non-competes for senior executives may have relatively greater benefits for consumers than prohibiting non-competes for other workers.[651]

Based on the Commission's expertise and after careful review of the rulemaking record, including the empirical research and the public comments, the Commission finds that non-competes with senior executives tend to negatively affect competitive conditions in markets for products and services, inhibiting new business formation and innovation.

Non-Competes With Senior Executives Inhibit New Business Formation and Innovation

In Part IV.B.3.b, the Commission described the extensive empirical evidence indicating that non-competes inhibit new business formation and innovation. The Commission's finding in Part IV.B.3.b that non-competes inhibit new business formation and innovation does not examine non-competes with senior executives specifically. However, the Commission finds that non-competes with senior executives inhibit new business formation and innovation at least as much as non-competes with other workers and likely to a greater extent, given the outsized role of senior executives in forming new businesses, serving on new businesses' executive teams, and setting the strategic direction of businesses with respect to innovation.

Specifically, non-competes with senior executives tend to negatively affect competitive conditions in product and service markets in three ways. First, non-competes with senior executives inhibit new business formation. In Part IV.B.3.b.i, the Commission finds that non-competes with workers other than senior executives inhibit new business formation. The Commission finds that non-competes with senior executives inhibit new business formation as much as non-competes with other workers and likely to a greater extent, due to the important role senior executives play in new business formation.

Senior executives are particularly well-positioned to form new businesses because of their strategic expertise and business acumen; knowledge of multiple facets of their industries; experience making policy decisions for businesses; and ability to secure financing. Senior executives are also often crucial to the formation of startups, because startups often begin by

[645] *See* Part IV.B.1.

[646] *See* Part I.B.2 (noting studies estimating that about two-thirds of senior executives work under non-competes).

[647] *See* Part IV.C.2.i–ii (describing the negative effects of non-competes with senior executives on markets for products and services and labor markets).

[648] NPRM at 3502.

[649] *Id.* at 3513.

[650] *Id.*

[651] *Id.*

forming a leadership team, which is often comprised of experienced and knowledgeable executives from elsewhere in the industry.[652] Empirical research shows that when startups hire top management teams from other firms, they are more likely to grow beyond their initial stages [653] and that top managers' experience in an industry allows startups to grow more quickly.[654] Additionally, empirical research finds that startups that hire top management teams with experience are more likely to become successful businesses.[655] Empirical research also finds that, in addition to experience, top management teams that have worked together in the past are more successful than those that have not.[656] For these reasons, non-competes with senior executives not only inhibit new business formation by blocking the executives from forming new businesses; they also prevent other potential founders from forming new businesses, because potential founders are less likely to start new businesses when they are unable to assemble the executive team they need because so many executives in the industry are tied up by non-competes. By inhibiting new business formation, these non-competes deprive product and service markets of beneficial competition from new entrants—competition that in turn tends to benefit consumers through lower prices or better product quality.

Second, non-competes with senior executives inhibit innovation. In Part IV.B.3.b.ii, the Commission finds that non-competes with workers other than senior executives inhibit innovation. The Commission finds that non-competes with senior executives inhibit innovation at least as much as non-competes with other workers and likely to a greater extent, because senior executives play a crucial role in setting the strategic direction of firms with respect to innovation.

Non-competes with senior executives inhibit innovation by impeding efficient matching between workers and firms. As described in Part IV.B.3.a, labor markets function by matching workers and employers. The same is true for senior executives. Executives compete for roles at firms, and firms compete to attract (often highly sought-after) executives; executives choose the role that best meets their objectives, and firms choose the executive who best meets theirs. Non-competes impede this competitive process by blocking executives from pursuing new opportunities (*i.e.,* positions that are within the scope of their non-compete) and by preventing firms from competing to attract their talent. Thus, because non-competes are prevalent, the quality of the matches between executives and firms suffers.

By inhibiting efficient matching between firms and executives, non-competes frustrate the ability of firms to hire executives who can best maximize the firm's capacity for innovation. Senior executives play an important role in advancing innovation at firms.[657] Senior executives are often a fundamental part of the innovative process, guiding the strategic direction of the firm in terms of topics of new research and the depth of new research; determining the allocation of R&D funding; and making the decision to develop (and supervising the development of) new products and services.[658]

Research shows that labor mobility among senior executives may tend to foster innovation. Empirical research finds that executives with shorter job tenures tend to engage in more innovation than those who are longer tenured at firms.[659] In addition, empirical research shows that the strength of executives' external networks—which are likely stronger among executives hired externally—increase the rate of innovation.[660] Finally, when senior executives are hired by new companies, they bring their experience and understanding of the industry, which may cross-pollinate with the capabilities of the new company, cultivating new research which would not otherwise be achieved.[661] By inhibiting efficient matching between executives and firms, non-competes impede the ability of firms to develop innovative products and services that benefit consumers.

Furthermore, empirical research shows that better matching among executives and firms drives productivity as well as innovation. When firms and executives have a higher quality match, the firm as a whole is more productive.[662] By inhibiting efficient matching between firms and executives, non-competes tend to reduce the productivity of firms.

In theory, firms that seek to hire an executive could just pay the executive's employer (or former employer) to escape the non-compete. However, research by Liyan Shi describes how non-competes with senior executives force firms to make inefficiently high buyout payments. Shi ultimately concludes that ''imposing a complete ban on noncompete clauses would be close to implementing the social optimum.'' [663]

Shi explains that firms and executives jointly create market power by entering into non-competes and excluding rivals from hiring experienced labor in a competitive labor market. The existence of a non-compete forces rivals to make an inefficiently high buyout payment, where the inefficiency arises due to the market power of the incumbent firm created by the non-compete. Rival firms must either make these payments, which therefore lead to deadweight economic loss, or forgo the payment—and, consequently, the ability to hire a talented executive (and perhaps the ability to enter the market at all, for potential new firms).[664] New and small businesses in particular might be unable to afford these buyouts. By calibrating

[663] Shi, *supra* note 84 at 427.

[664] *Id.*

this theoretical model to data on executive non-competes and executive compensation, the study shows that banning non-competes would result in nearly optimal social welfare gains.

Shi notes that such a mechanism could be tempered by the ability of a labor market to provide viable alternative workers for new or competing businesses. However, when a particular type of labor is somewhat scarce, when on-the-job experience matters significantly, or when frictions prevent workers from moving to new jobs—all of which tend to be the case for senior executives—there is no way for the market to fill the gap created by non-competes.

Some of the evidence in this study arises from analysis of non-compete use coupled with non-compete enforceability. Other evidence in the study, including the finding that a ban on non-competes is close to optimal, relies not on use at the individual level, but on prevalence of non-competes across a labor market. The latter approach does not rely, therefore, on comparing individuals with and without non-competes, and is therefore not subject to the estimation bias that leads the Commission to give less weight to evidence based on the use of non-competes.

Relevant Comments and Commission Responses

Many commenters stated that non-competes with senior executives reduce new business formation and innovation, confirming the Commission's findings. Several senior executives recounted personal experiences in which a non-compete prevented them from starting a business. A tech executive stated that they knew many tech executives who would have left their roles to start within-industry spinoffs if not for their non-competes. A senior executive stated that they had planned to start a small business that would not have harmed the former employer but had signed a non-compete that prevented them from doing so. A former executive stated that they were sued after starting a new business despite confirming with the CEO of their former employer that doing so would not violate the non-compete. Another senior executive said their non-compete prevented them from taking a job at a smaller, more innovative company in their industry. Some commenters warned that permitting non-competes for senior executives would reinforce dominant positions for industry incumbents who can foreclose new entrants from access to critical talent and expertise. An advocate for startups stated that small businesses significantly benefit from mentorship from experienced founders, which can be inhibited by non-competes.

Other commenters argued that the Commission should exclude senior executives from coverage under the final rule because doing so would benefit competition in product and service markets. These commenters generally stated that non-competes may promote innovation by encouraging firms to make productivity-enhancing investments, such as investments in developing trade secrets. The Commission does not believe that non-competes are needed to protect valuable firm investments. As discussed in Part IV.D, the Commission finds that employers have less restrictive alternatives for protecting valuable investments and that these alternatives are available for senior executives as well as for other workers.

In addition, when assessing how non-competes with senior executives affect competition in product and service markets, the Commission believes it is important to consider the net impact. It is possible that the effects described by these commenters and the effects described by the Commission earlier in this Part IV.C.2.c.i can be occurring at the same time. That is, a non-compete with a senior executive might in some instances be protecting a firm's investments in a manner that is productivity-enhancing, holding all else equal. At the same time, however, that same non-compete may restrict the executive's ability to start a new business after leaving the firm. And even that same non-compete can—and certainly non-competes in the aggregate do—prevent the most efficient match between senior executives and the firms that can make the highest and best use of their talents, and decrease knowledge flow between firms, which limits the cross-pollination of innovative ideas. What the empirical evidence shows is that overall, *i.e.,* in net effect, non-competes reduce new business formation and innovation,[665] indicating that the tendency of non-competes to inhibit new business formation and innovation more than counteracts any effect of non-competes on promoting new business formation and innovation by protecting a firm's investments.

A commenter—referencing the Shi study—argued that banning buyout clauses in non-competes would enhance economic efficiency relative to banning non-competes altogether. Other commenters, including Shi, the author of the study, disagreed with this claim.[666] In response to these comments, the Commission finds that prohibiting buyout clauses would not enhance efficiency relative to prohibiting non-competes altogether. The Commission does not believe prohibiting buyout clauses would address the tendency of non-competes for senior executives to negatively affect competitive conditions, because it would mean that fewer executives could escape their non-competes, reducing labor mobility and efficient matching between executives and firms even further.

Some commenters disputed the Commission's legal rationale for prohibiting non-competes with senior executives. One comment stated that the NPRM did not cite any case law where a non-compete for a senior executive violated antitrust law and argued that there is no widespread case law to support a *per se* ban. In response, the Commission notes that it is determining that non-competes are an unfair method of competition under section 5, not a *per se* violation of the Sherman Act. For the reasons described in this Part IV.C.2, the Commission finds that non-competes are restrictive and exclusionary and that, based on the totality of the evidence, they tend to negatively affect competitive conditions at least as much as non-competes with other workers, and likely even more so, given the outsize role of senior executives in new business formation and innovation. For these reasons, the Commission finds that these non-competes are an unfair method of competition under section 5.

Another commenter stated that the NPRM did not satisfy the standard for finding a tendency to negatively affect competitive conditions for senior executives as set forth in the Commission's section 5 Policy Statement.[667] The commenter stated that a *per se* ban on non-competes considers neither the size, power, or purpose of the firm nor how non-competes interact with individual markets. The commenter argued that the evidence cannot justify an economy-wide ban.

The Commission finds that non-competes for senior executives are an unfair method of competition under section 5 for all the reasons described in this Part IV.C.2. The Commission states the applicable legal standard under section 5 in Part II.F, which is consistent with the standard set forth in the Policy Statement. As noted in Part

[665] *See* Part IV.B.3.b.i–ii.

[666] Comment of Liyan Shi, FTC–2023–0007–19810.

[667] *See* FTC Policy Statement, *supra* note 286.

II.F, the Commission need not make a separate showing of market power or market definition. Nor must the Commission show that the conduct directly caused actual harm in the specific instance at issue. Instead, the inquiry under section 5 focuses on the nature and tendency of the conduct. Moreover, as noted in Part II.F, the Commission may consider the aggregate effect of conduct as well. The language in the Policy Statement stating that the size, power, and purpose of the respondent may be relevant is not limiting, but instead provides guidance regarding factors the Commission may consider in evaluating potentially unfair methods of competition. This guidance may be especially relevant in individual cases and less so in section 5 rulemakings. Finally, as described in Part II.F, a finding that conduct is an unfair method of competition does not require definition of a market or consideration of individual markets. Moreover, as described in Part V.D, the Commission considered and finds no basis for excluding particular industries or workers.

ii. Non-Competes With Senior Executives Tend to Negatively Affect Competitive Conditions in Labor Markets

The effects of non-competes with senior executives on product and service markets are the primary reason why the Commission finds that non-competes with senior executives are an unfair method of competition. However, non-competes also tend to negatively affect competitive conditions in labor markets.

Non-Competes With Senior Executives Suppress Labor Mobility and Earnings

In Part IV.B.3.a, the Commission describes extensive empirical evidence that non-competes reduce labor mobility and worker earnings. The Commission's finding in Part IV.B.3.a that non-competes suppress labor mobility and earnings does not examine non-competes with senior executives specifically. However, the evidence cited by the Commission is also probative with respect to non-competes with senior executives.

Non-competes reduce labor mobility for senior executives for the same reasons they reduce labor mobility for other workers—they directly restrict workers from seeking or accepting other work or starting a business after they leave their job. In Part IV.B.3.a.i, the Commission cites empirical evidence that non-competes reduce labor mobility. This evidence shows that non-competes reduce labor mobility for all subgroups of workers that have been studied, including inventors, high-tech workers, low-wage workers, and workers across the labor force. The impact of non-competes on labor mobility is direct, since non-competes directly prohibit certain types of mobility. Therefore, the Commission finds the non-competes restrict the labor mobility of senior executives as well.

This finding is supported by Mark Garmaise's study of the relationship between non-compete enforceability and the labor mobility and earnings of executives.[668] Garmaise finds that stricter non-compete enforceability reduces within-industry executive mobility by 47% and across-industry executive mobility by 25%. The study, which is limited to senior executives, uses multiple legal changes in non-compete enforceability, measured along multiple dimensions in a binary fashion. The Shi study qualitatively confirms these results—that executives experience greater labor mobility in the absence of non-competes.[669] However, that study examines use, and not just enforceability, of non-competes, so the Commission gives it less weight.

Furthermore, by inhibiting efficient matching between executives and firms—through a similar mechanism as for all other workers [670]—non-competes reduce executives' earnings. Like non-competes for other workers, non-competes block senior executives from switching to a job in which they would be better paid. And by doing so, non-competes decrease opportunities (and earnings) for senior executives who are not subject to non-competes—as well as for workers who are not senior executives, but who would otherwise move into one of those roles.

As described in Part IV.B.3.a.ii, the empirical research indicates that non-competes suppress wages for a wide range of subgroups of workers across the spectrum of income and job function, including workers who are not subject to non-competes. Importantly, an empirical study that does focus on senior executives finds that non-competes suppress earnings of senior executives. The Garmaise study finds that decreased enforceability of non-competes increases executives' earnings by 12.7%.[671] Garmaise also finds that decreased enforceability of non-competes increases earnings growth for CEOs by 8.2%. Since much of the increase in earnings is attributable to an increase in earnings growth (as opposed to earnings at the start of the employment relationship), Garmaise hypothesizes that earnings increase because CEOs are more likely to invest in their own human capital when they have no non-compete.[672] However, Garmaise also notes that while non-competes may offer benefits to firms which use them, there may be negative impacts across the labor markets in which they are used.[673] This is the only study of executive earnings that does not examine the use of non-competes: it examines multiple legal changes in non-compete enforceability, measured along multiple dimensions (though in a binary fashion).

As noted in Part IV.C.1, many senior executives negotiate valuable consideration for non-competes. However, the evidence suggests that non-competes still have a net negative effect on senior executives' earnings, because the suppression of earnings through reduced labor market competition more than cancels out the compensation that some of these executives individually receive for their non-competes.

A second study, by Kini, Williams, and Yin,[674] simultaneously estimates the impact of non-compete enforceability and non-compete use on earnings and finds a positive correlation. The Commission gives this study less weight because it analyzes the use of non-competes. As described in Part IV.A.2, such studies cannot easily differentiate between correlation and causation. Kini, Williams, and Yin use an enforceability measure to generate their estimates, but do not estimate models that omit use of non-competes, meaning that the Commission does not interpret the findings as representing a causal relationship.

Relevant Comments and Commission Responses

Many commenters addressed negative effects of non-competes with senior executives on competition in labor markets. Non-competes, these commenters stated, can negatively affect a senior executive's career when they leave their field or sit out of the workforce for a period, causing their skills and knowledge (particularly in fast-paced fields) to stagnate and affecting their reputations. Like other workers, some senior executives said their non-compete limited their options and earnings in their specialized field.

[668] Garmaise, *supra* note 584.

[669] Shi, *supra* note 84.

[670] *See* Part IV.B.3.a.

[672] *Id.* at 402.

[673] *Id.* at 379.

[674] Kini, Williams, & Yin, *supra* note 83.

Other commenters argued the Commission should exclude senior executives from the rule because they earn more compensation, including higher wages, for non-competes than they would gain under the final rule. Many of these commenters argued that because senior executives have bargaining power, any findings on decreased wages would not apply to them. Some employers stated they compensated their senior executives for non-competes. Some industry organizations stated that some additional compensation and bonuses might not be offered if non-competes are banned. One business stated the compensation it pays executives takes their non-competes into account. Another business stated it provides severance benefits in exchange for non-competes that fully compensate the executive for the duration of the non-compete.

In response to these comments, the Commission notes the Garmaise study indicates that non-competes have a net negative effect on earnings for senior executives in the aggregate because they suppress competition, even if individual senior executives receive some amount of compensation for their personal non-compete. Garmaise's analysis accounts for any compensation the executive receives for the non-compete.

An industry trade organization stated that non-competes create job opportunities for executives and other highly skilled workers, rather than restricting them, because, without non-competes to protect confidential information, employers will often be reluctant to expand their executive teams. The Commission notes this assertion is unsupported by empirical evidence, and the Commission finds that firms have less restrictive alternatives for protecting confidential information.[675]

An investment industry organization stated that the Commission cannot assume senior executives will be equally or more effective at new firms compared to their old firms. In response, the Commission notes that voluntary labor mobility—for senior executives and all workers—typically reflects a mutually beneficial outcome. To the extent a firm is willing to pay more to attract a particular worker to come work for them, it is typically because the firm places a higher value on the worker's productivity than the worker's current employer. In addition, the Commission notes that many commenters stated that non-competes often force senior executives to sit out of the workforce, causing them to lose valuable knowledge and skills. In general, senior executives are more likely to be effective when they can remain in the industry in which they have experience and expertise, rather than starting over in a new industry because of a non-compete.

An industry trade organization stated that the Commission's assertion that wages are reduced across the labor market is inconsistent with the NPRM's preliminary finding that non-competes are not coercive or exploitative for senior executives, because when more issues are left for negotiation, the job market is increasingly competitive, as workers can differentiate themselves through their terms and tailor their terms to each employer. The Commission does not believe these findings are in tension. Agreements do not need to be exploitative or coercive to inhibit efficient matching between workers and firms or to negatively affect competitive conditions. Furthermore, the Commission believes that executives have many other ways to differentiate themselves other than based on non-compete terms.

One commenter argued that the findings in the Kini, Williams, and Yin study should not be interpreted as representing a causal relationship. Upon further consideration, the Commission agrees with this comment and does not interpret this study causally, as described in this Part IV.C.2.c.ii.

For these reasons, the Commission finds that non-competes with senior executives are an unfair method of competition. As a result, the Commission declines to exclude senior executives from the final rule altogether.

3. The Final Rule Allows Existing Non-Competes With Senior Executives To Remain in Effect

The final rule prohibits employers from, among other things, entering into or enforcing new non-competes with senior executives—*i.e.,* non-competes entered into on or after the effective date.[676] However, the Commission decides to allow existing non-competes with senior executives—*i.e.,* non-competes entered into before the effective date—to remain in effect. The Commission describes the basis for this determination in this Part IV.C.3.

The Commission believes the evidence could provide a basis for prohibiting employers from enforcing existing non-competes with senior executives, as the final rule does for all other workers, given the tendency of such agreements to negatively affect competitive conditions.[677] However, the Commission has decided to allow existing non-competes for senior executives to remain in effect, based on two practical considerations that are far more likely to be present for senior executives than other workers. First, as described in Part IV.C.1, senior executives are substantially less likely than other workers to be exploited or coerced in connection with non-competes. As a result, this subset of workers is substantially less likely to be subject to the kind of acute, ongoing harms currently being suffered by other workers with existing non-competes (even if senior executive's existing non-competes are still harming competitive conditions in the economy overall). Second, commenters raised credible concerns about the practical impacts of extinguishing existing non-competes for senior executives, as described in this Part IV.C.3.[678]

Numerous businesses and trade associations argued that, if the final rule were to invalidate existing non-competes for senior executives, that would present practical challenges for employers, because many such non-competes were exchanged for substantial consideration. According to commenters, consideration exchanged for non-competes includes long-term incentive plans, bonuses, stock awards, options, or severance payments, among other arrangements.

Some commenters were concerned about a potential windfall for workers. They argued that if the non-compete portion of the contract were rescinded or otherwise invalidated, the worker may be left with any benefits already received in exchange for the non-compete, such as equity or bonuses, and could also compete. An industry association stated that some of its members' workers have already received thousands or hundreds of thousands of dollars in additional compensation alongside non-competes, though it was unclear what each worker received. Some business associations said businesses do not have a clear way to recover those payments or benefits. A commenter asked whether a worker who forfeited equity for competing could get the equity back or if executives who were compensated by their new

[675] *See* Part IV.D.2.

[676] § 910.2(a)(2).

[677] *See* Part IV.C.2

[678] Because the Commission proposed to require employers to rescind existing non-competes—*see* NPRM, proposed § 910.2(b)(1)—many of these comments addressed the proposed rescission requirement specifically. Comments that pertain only to the issue of rescission, and that do not apply to whether existing non-competes for senior executives may remain in effect generally, are addressed in Part IV.E.

employers for the non-compete would be paid twice.

The Commission views the problem as more complex than these commenters suggest. First, the empirical evidence and comments illustrate that in many cases, non-competes are currently trapping workers, including senior executives, in their jobs, meaning the employer is getting not only the benefit of trapping that individual worker, but also the benefit of non-competition.[679] In such circumstances, employers may have already received part or all of the benefit they sought from entering a non-compete, though the value would be difficult if not impossible to quantitatively assess. Moreover, it is impracticable for the Commission to untangle whether, to the extent some workers received compensation that was denominated consideration for a non-compete, that non-compete simultaneously suppressed other compensation to the worker such as wages. For example, some commenters who described negotiating their non-competes stated the employer used it as a tactic to drive down wages.

In addition, most workers subject to a non-compete are subject to other restrictive covenants,[680] both mitigating any purported harm and complicating any quantitative valuation of a non-compete.

The Commission also notes that, to the extent equity was provided as consideration, owning a share in the prior employer may induce workers not to risk lowering the value of that equity by competing. However, the concern about workers seeking already-forfeited compensation is misplaced, as the final rule will not impact workers who forfeited compensation for competing under a then-valid non-compete.

Overall, however, where an employer has provided meaningful consideration in exchange for a non-compete, the comments indicate that being unable to enforce that non-compete may complicate that exchange in a way that would be difficult to value and untangle. These difficult practical assessments indicate that the final rule should contain a limited, easily administrable exception for existing non-competes with senior executives, who are considerably more likely than other workers to have negotiated non-competes and received substantial consideration in return.

In addition, an employment attorney suggested that employers may suspend any mid-stream benefits and terminate unvested options and stock and cancel bonuses. One commenter suggested employers may seek refunds from workers, which could create uncertainty. Similarly, an industry association said senior workers who signed a non-compete as part of a severance agreement might see their severance payments taken away, as employers would need to decide whether to continue paying despite the elimination of non-competes or, to the extent they legally can, attempt to renegotiate any outstanding severance agreements. Finally, a business said executives in the middle of their contracts might need to renegotiate those contracts. The Commission shares these concerns about the practicalities of untangling non-competes that are more likely to have been bargained for. Senior executives who engaged in a fair bargaining process may have obtained significant consideration and planned accordingly, as have their employers. While employers' ability to stop payments or claw back consideration is uncertain, any efforts to do so could be disruptive.

Other commenters stated that they believed rescission could result in litigation against workers. An employment lawyer said litigation was difficult to predict but that there could be litigation seeking declarations from courts on how the rule impacts existing contracts. A group of commenters stated that rescinding or invalidating agreements would lead to increased litigation against workers who received the benefit of the bargain but were no longer bound by a non-compete in exchange, and that such litigation would seek to nullify severance agreements, employment agreements, clawback agreements, and others.

One business said the NPRM was silent on how to address specially taxed arrangements, but the business did not provide additional details on any such arrangements. A law firm said workers who received consideration in a prior year would have paid taxes on it and would now need to amend their prior tax return to get a refund if they have to pay back that consideration, while employers might have to amend their return to reflect the loss of a deduction. That law firm also said some executives and other workers use and plan for non-competes to reduce their ''golden parachute'' tax burden.

Finally, an accountant explained that valuations of senior executive non-competes are conducted during many merger and acquisition transactions. Similarly, an industry association said acquisition prices may include the value of non-competes that ensure the buyer retains certain talent, so if non-competes were rescinded or invalidated the buyer would lose the value of what they paid for with no way to recoup the costs. The commenter stated that the bargained-for value of such sales may decrease if existing senior executive non-competes cannot be enforced. The exemption for existing non-competes addresses this concern. Moreover, this concern does not exist for future transactions in any event, since they would not account for non-competes that have been banned.

In response to the foregoing comments, the Commission finds it plausible that rendering existing non-competes with senior executives enforceable could create some of these practical implementation challenges. The Commission accordingly elects to exclude existing non-competes with senior executives from the rule, reducing the burden of implementation of the final rule.

The Commission also understands that some of these practical concerns could arise for workers other than senior executives if they received substantial consideration in exchange for a non-compete. However, the evidence indicates that any such agreements with workers other than senior executives are very rare, and that such workers are more likely to experience exploitation and coercion in connection with non-competes. Therefore, allowing only existing non-competes with senior executives to remain in force will significantly reduce these practical concerns for employers. In contrast, a wider exemption for all existing agreements would leave in place a large number of non-competes that tend to harm competitive conditions, including a large number of exploitative and coercive non-competes for which no meaningful consideration was received.

Some commenters suggested the Commission exempt from the final rule non-competes in exchange for which the worker received consideration. One business asked for an exception to the final rule for paid non-competes, asserting that such an exception would allow workers to receive guaranteed payments while accessing information and training and would allow workers to start their own businesses after the non-compete period. Another business recommended allowing non-competes that provide severance equal to a worker's salary for the non-compete period. An employment attorney suggested an exception from the rule for non-competes that are part of a severance agreement or where the

[679] *See* Part IV.B.2.b.

[680] *See* Balasubramanian, Starr, & Yamaguchi, *supra* note 74 (finding that 97.5% of workers with non-competes are also subject to a non-solicitation agreement, NDA, or non-recruitment agreement, and 74.7% of workers with non-competes are also subject to all three other types of provisions).

worker receives a paid non-compete period or garden leave, which the attorney says do not align with the Commission's concerns about non-competes and represent a balanced trade-off.

The Commission declines to adopt an exception for non-competes in exchange for which the worker received consideration (whether under an existing or future non-compete). The fact that a worker received compensation for a non-compete does not mean the worker received fair compensation, *i.e.,* compensation commensurate with earnings that would be received in a competitive labor market. In addition, such an exception would raise significant administrability concerns. For example, a rule that exempts non-competes exchanged for ''substantial consideration'' or ''meaningful consideration'' would not provide sufficient clarity to employers and workers to avoid significant compliance costs and litigation risks. Requiring a brighter-line specific amount (or standard) of compensation would be unlikely to appropriately capture highly fact-specific, varying financial circumstances of workers and firms. Moreover, it would be difficult to prevent employers from suppressing compensation or benefits along other dimensions (*e.g.,* a requirement for severance equal to the worker's salary during the non-compete period as one commenter suggested could lead to the salary being suppressed). The Commission also notes, however, that while it is not adopting a blanket exemption from the final rule for non-competes in exchange for which the worker received consideration, it is satisfying this request to some extent by adopting an exemption for existing non-competes for senior executives, which are the non-competes most likely to have been exchanged for consideration.

Finally, the Commission concludes that allowing existing non-competes for senior executives to remain in effect is appropriate despite the significant negative effects of such non-competes on competition described in Part IV.C.2. The Commission took into consideration that non-competes with senior executives are less likely to be causing ongoing harm to individuals by preventing them from seeking or accepting other work or starting their own business, because such non-competes were likely to have been negotiated or exchanged for consideration. In addition, the negative effects of these non-competes on competitive conditions will subside over time as these non-competes expire.

4. Defining Senior Executives

As noted earlier, the Commission did not define the term ''senior executive'' in the NPRM. Instead, the Commission requested comment on how the term should be defined.[681] In this final rule, the Commission adopts a definition of ''senior executive'' to isolate the workers who are least likely to have experienced exploitation and coercion and most likely to have bargained for meaningful compensation for their non-compete. Workers for whom exploitation and coercion concerns are likely most relevant and who are unlikely to have bargained for or received meaningful consideration for a non-compete—namely, lower-earning workers, and relatively higher paid or highly skilled workers who lack policy-making authority in an organization—do not fall within this final definition.

This definition is relevant because, as explained in Part IV.C.2, the basis for the Commission's findings that non-competes with senior executives are unfair methods of competition differs in some ways from the evidence and rationales underpinning its findings that non-competes with other workers are unfair methods of competition. Furthermore, as explained in Part IV.C.3, the final rule allows existing non-competes with senior executives to remain in force, while prohibiting employers from enforcing existing non-competes with other workers after the effective date.

The Commission defines ''senior executives'' based on an earnings test and a job duties test. In general, the term ''senior executives'' refers to workers earning more than $151,164 [682] who are in a ''policy-making position'' as defined in the final rule. The Commission adopted this definition after considering the many comments on who senior executives are and how to define them. Notably, the Commission concluded that, unlike highly paid senior executives, highly paid workers other than senior executives and lower-wage workers with senior executive titles as a formal matter likely experience exploitation and coercion and are unlikely to have engaged in bargaining in connection with non-competes, much like lower-wage workers.[683] In other words, the Commission finds that the only group of workers that is likely to have bargained for meaningful compensation in exchange for their non-compete is senior executives who are both highly paid and, as a functional matter, exercise the highest levels of authority in an organization.[684] The Commission estimates that approximately 0.75% of workers are such senior executives.[685]

a. Definition of ''Senior Executive''

The NPRM requested comment on how to define senior executives while providing sufficient clarity to employers and workers.[686] The NPRM stated that there is no generally accepted legal definition of ''senior executive'' and that the term is challenging to define given the variety of organizational structures used by employers.[687] The NPRM raised the possibility of looking to existing Securities and Exchange Commission (''SEC'') definitions; adopting a definition closely based on a definition in an existing Federal regulation; adopting a new definition; defining the category according to a worker's earnings; using some combination of these approaches; or using a different approach.[688] Commenters proposed a wide variety of definitions, largely focused on two types: an exception based on a worker's job duties or title, and an exception based on a compensation threshold. Upon review of the full record, the Commission determines that a test that combines both of these criteria best captures the subset of workers who are likely to have bargained for meaningful compensation in exchange for their non-compete in a readily administrable manner.

i. The Need for a Two-Part Test

Many commenters suggested combining a compensation threshold with a job duties test. For example, one business supported excepting workers who met a combination of tests based on a compensation threshold, FLSA exemption status, and access to trade secrets. A law firm suggested the final rule should account for both pay, exempting only low-wage hourly workers, and job duties in determining an exception. One commenter suggested defining ''senior executive'' based on total compensation, job title, and job duties. Though the Commission does not adopt these specific duties and wage combinations, the Commission agrees that a combined approach is necessary.

The Commission has determined that the definition of ''senior executive'' should include both a compensation threshold and job duties test, similar to

[681] NPRM at 3520.

[688] *Id.*

the DOL regulations that define and delimit the FLSA's exemption for executive employees.[689] The key advantage of a compensation threshold, as one industry organization commenter stated, is that compensation thresholds are objective and easily understood by all stakeholders—yielding significant administrability benefits. However, since not all workers above any given compensation threshold are senior executives, a job duties test is also needed to identify senior executives.

The two-part test isolates the workers most likely to have bargaining power to negotiate meaningful consideration for a non-compete and least likely to experience exploitation and coercion in connection with non-competes. A compensation threshold ensures that stakeholders do not need to spend time assessing the job duties of workers below the threshold—minimizing the amount of detailed analysis stakeholders must undertake. A compensation threshold also helps ensure that workers who work in positions with ''senior executive'' classifications but likely lack meaningful bargaining power due to their relatively low incomes and who likely did not receive meaningful consideration for a non-compete are excluded from the definition. The job duties test ensures that the definition identifies the individuals most likely to have bespoke, negotiated agreements—those with the highest level of authority over the organization—while also ensuring that high-earning workers who are not senior executives, who likely experience exploitation and coercion from non-competes and do not generally bargain over them, are not captured by the definition.[690]

Clarity from a compensation threshold is essential, as without clarity workers and employers would often be uncertain about a non-compete's enforceability (absent adjudication), and such uncertainty often fosters *in terrorem* effects.[691] For example, an attorney commenter stated that an exception for executive, management, and professional employees and those with access to trade secrets would inherently lack clarity. A lack of clarity could also facilitate evasion by employers, as one law firm commented.

While there may be some workers other than senior executives as defined here who may have bargained for consideration for a non-compete, the benefits to workers and employers of a clear and administrable definition outweigh the risk that some bargained-for non-competes are invalidated. In Part IV, the Commission finds even bargained-for non-competes tend to negatively affect competitive conditions. The Commission finds that the need to avoid an overinclusive exception that increases those harms to competitive conditions outweighs the risk that in rare instances private parties with non-competes other than with senior executives may need to restructure their employment agreements to utilize less restrictive alternatives that burden competition to a lesser degree.

Many commenters sought an exception for senior executives and/or highly paid and highly skilled workers based on justifications such as access to trade secrets or confidential information, rather than compensation thresholds. Some argued that compensation thresholds do not align with or allow individualized assessments of which workers meet a given justification such as access to confidential information. One law firm commented that a bright-line compensation threshold would eliminate non-competes for lower wage workers while allowing non-competes for what the commenter viewed as legitimate business purposes. Some commenters opposed an exception for senior executives because they believed ''senior executive'' would be too difficult to define. In Part V.D.2, the Commission explains why it is not adopting an exception for workers based on their access to trade secrets and other intellectual property. Further, in the Commission's view, eliminating the need for individualized assessments for most workers is the primary advantage of a compensation threshold, not a drawback (although the Commission declines to adopt a compensation threshold alone for reasons stated previously and in Part V.D.1). However, the evidence indicates that an exception for existing senior executive non-competes is appropriate, which the Commission defines here.

Commenters, both those supporting and opposing the rule, pointed out several issues with compensation thresholds standing alone. Some commenters were concerned a compensation threshold would exclude some workers, such as many physicians, from the final rule's benefits based on their income level. Two commenters said an exception would penalize the advancement of workers near a threshold and those workers may have to choose between higher wages or being free from a non-compete. Including the job duties tests alongside the compensation threshold mitigates the risk of such cliff effects, assuming they exist (which is far from clear).

Some commenters asserted a threshold would need to be updated for inflation, while one law firm commented that frequent updates would make the final rule more difficult to understand and implement. Commenters also pointed out the need to explain when the threshold would be measured. While adjusting for inflation could be important to ensure the final rule continues serving its intended function if the compensation threshold governed a total exemption from the rule (as these commenters assume), it is unnecessary to the final rule because the exception adopted applies only to existing non-competes (*i.e.,* it has only one-time application). The Commission explains in Part IV.C.4.b its reasons for declining to adopt a locality adjustment.

ii. The Final Rule's Definition of ''Senior Executive''

Based on the considerations described in Part IV.C.4.a.i, the Commission adopts a two-pronged definition of ''senior executive'' in § 910.1. Under § 910.1, a senior executive is a worker who was in a policy-making position and who received from a person for the employment:

- Total annual compensation of at least $151,164 in the preceding year (under paragraph (2)(i)); or
- Total compensation of at least $151,164 when annualized if the worker was employed during only part of the preceding year (under paragraph (2)(ii)); or
- Total compensation of at least $151,164 when annualized in the preceding year prior to the worker's departure if the worker departed from employment prior to the preceding year and the worker is subject to a non-compete (under paragraph (2)(iii)).

Paragraph (2)(ii) applies to workers who were in a policy-making position during only part of the preceding year, which includes workers who were hired or who left a business entity within the preceding year as well as workers who were promoted to or demoted from a policy-making position in the preceding year. Paragraph (2)(iii) ensures that the exception applies to senior executives who departed from the employer more than one year before the effective date but are still subject to a non-compete (*e.g.,* a worker who left more than a year ago and has a non-compete term of 18 months). To account for those senior executives, paragraph (2)(iii) considers total annual compensation in the year preceding their departure.

[689] The FLSA is the Federal statute establishing minimum wage, overtime, recordkeeping, and youth employment standards. *See* 29 U.S.C. 201 *et seq.*

[690] *See* Part IV.C.1.

[691] *See* Part IX.C.

To clarify the definition's compensation threshold, the final rule includes definitions of ''total annual compensation'' and ''preceding year.'' To clarify the job duties test, the final rule includes definitions of ''policy-making position'' as well as two additional terms that are in the definition of ''policy-making position'': ''officer'' and ''policy-making authority.'' These definitions are described in Parts IV.C.4.b and IV.C.4.c.

b. Defining the Compensation Threshold

Pursuant to § 910.1, the senior executive exception applies only to workers who received total annual compensation of at least $151,164 from a person for employment in a policy-making position in the most relevant preceding year. Section 910.1 further defines ''total annual compensation'' and ''preceding year,'' respectively. This threshold is based on the 85th percentile of earnings of full-time salaried workers nationally.[692]

The Commission draws this line between more highly paid and less highly paid workers based on its assessment of which workers are more likely to experience exploitation and coercion and less likely to have engaged in bargaining in connection with non-competes and the need to implement a two-part test. As commenters noted, there is no single compensation threshold above which zero workers will have been coerced and exploited and below which zero workers will have been uncompensated for the non-compete that binds them. Based on the Commission's expertise and after careful review of the rulemaking record, including relevant data, the empirical research, and the public comments, the Commission concludes $151,164 in total annual compensation reflects a compensation threshold under which workers are likely to experience such exploitation and coercion and are less likely to have bargained for their non-competes, while providing employers a readily administrable line. With this line, market participants can easily know that workers below the line cannot be subject to non-competes, minimizing both *in terrorem* effects and eliminating the administrative burden of conducting a job duties test for those workers.

The Commission looked to several sources and suggestions from the comments in selecting a threshold. Numerous commenters suggested the Commission should look to the FLSA, and some specifically recommended the FLSA regulations' threshold for highly compensated employees.[693] DOL sets the compensation threshold for highly compensated employees in its overtime regulations under the FLSA based on earnings of full-time salaried workers. Since January 2020, based on a regulation adopted in 2019, that threshold is $107,432 and reflects the 80th percentile of full-time salaried workers nationally using combined 2018 and 2019 data.[694] In September 2023, DOL proposed raising that threshold to the 85th percentile of full-time salaried workers nationally and, *inter alia,* updating the amount to reflect more current earnings data. For 2023, the 85th percentile of full-time salaried workers nationally is $151,164.[695] The Commission recognizes DOL's expertise in determining who qualifies as a highly compensated worker and employers' likely familiarity with DOL regulations. Given this familiarity, the Commission borrows from DOL's definition of compensation to minimize compliance burdens on employers.

Another Federal regulatory threshold for high wage workers noted by commenters also aligns with the 85th percentile of full-time salaried workers nationally in 2023 or approximately $150,000. In the retirement context, the IRS sets a threshold for highly compensated employees at $150,000 for 2023 and $155,000 for 2024.[696] Additionally, the District of Columbia bans non-competes for workers making less than $150,000.[697]

The Commission analyzed occupational wage data to identify a threshold that would capture more highly paid senior executives, who are likely to have bespoke, negotiated non-competes. BLS's most recent wage data indicates that workers in the ''chief executive'' category have a median wage of $209,810.[698] Thus, most ''chief executives,'' most if not all of whom would meet the duties component of the two-part test in this final rule, earn well above the $151,164 compensation threshold, ensuring that the threshold is likely not underinclusive. The Commission notes that some very high-wage occupations have a median wage above $151,164, including: physicians; surgeons; computer and information systems managers; and dentists.[699] To qualify for the exemptions, these workers would have to also meet the job duties portion of the senior executive test, which is appropriate because the Commission finds that workers in these professions are often subject to coercion and exploitation and rarely have bespoke, negotiated non-competes.

The Commission also considered a lower wage threshold of approximately $100,000, which would be closer in range to the DOL highly compensated employee threshold of $107,432 that DOL adopted in 2019. According to 2022 BLS data, the median wage for ''top executives'' in the U.S. is $99,240.[700] Workers in the ''top executive'' category include ''chief executives,'' but also include officials with less authority like ''general and operations managers.'' The latter have an annual median wage of $97,030 with their earnings at the 75th percentile being $154,440.[701] The Commission believes that a significant number of general and operations managers (some of whom may be in a policy-making position) likely do not have bespoke, negotiated non-competes. For example, a vice president of operations of a local retail chain with only a few locations would likely be in this category. The same vice president—unlike the vice president of a multinational

corporation—is unlikely to possess the same bargaining power or to have a bespoke, negotiated employment agreement. Moreover, to the extent an individual's total compensation is under $151,164, in the unlikely event the individual received consideration for their non-compete, such consideration is unlikely to represent a significant part of their compensation.

Similarly, the Commission believes a $107,432 (or thereabouts) threshold would be overinclusive and individuals who likely do not have bespoke, negotiated non-competes—and who were likely to be exploited and coerced—could meet the threshold test. The $107,432 threshold was adopted based on earnings in 2018 and 2019. Adjusting for inflation, $107,432 in June 2019 is the equivalent of $130,158 in February 2024. Moreover, as noted previously, BLS data reflect that chief executives generally earn significantly more than $130,158. In contrast, occupations with a median wage below $151,164 but above $107,432 include: advertising, marketing, promotions, public relations, purchasing, and sales managers; financial managers; software developers; physician assistants; optometrists; nurse practitioners; and pharmacists.[702] These are occupations that the comment record reflects often experience coercion and exploitation with respect to non-competes and rarely have negotiated or compensated non-competes. A civic organization commenter also argued that the DOL regulations' ''highly compensated employee'' definition's $107,432 threshold was close to the median wage in some industries and areas and cited several cases that it said demonstrate that adopting this threshold would exclude workers who are vulnerable to exploitation and coercion.

Accordingly, the Commission adopts a threshold of $151,164. This threshold, combined with the duties test, reflects highly compensated individuals who are most likely to have the bespoke, complex non-competes that the Commission elects to leave undisturbed, and who the Commission finds are less likely to experience coercion and exploitation. This threshold also has significant administrability benefits, as it is calculated in accord with definitions used in FLSA compliance, with which employers are generally familiar. This alignment will yield efficiency benefits that reduce compliance burdens on employers.

After careful review, the Commission decided not to choose a threshold higher or lower in part because as the compensation threshold in the rule increased, fewer small businesses and firms in areas with lower wages and costs of living would have senior executives with non-competes who would qualify for the exception as compared to larger businesses. Similarly, the lower a threshold is, the more workers who live in areas with higher wages and costs of living would fall above the threshold.[703]

The Commission also declines to adopt a locality adjustment. Some commenters said that a uniform national threshold could lead to geographic disparities because of the different cost of living and average incomes in different areas. Geographic disparities are difficult to resolve, as disparities often exist not just between States, but, for example, between urban and rural areas within a State. The Commission considered this factor in selecting the $151,164 threshold compared to other options. Tailoring a compensation threshold to every locality or even State or region would be burdensome and generate significant confusion for workers and employers. The Commission finds that the importance of a uniform threshold to avoid confusion and for administrability outweighs the drawbacks of any geographic disparities, particularly in light of comments from employers stating that the existing patchwork of State laws is burdensome to navigate. The Commission notes that neither DOL nor IRS have adopted thresholds for highly compensated individuals that vary geographically. Given the rise in remote work, applying geographic variation to employers and workers would also prove burdensome. Moreover, total annual compensation under § 910.1 includes traditional bonuses or compensation a senior executive might receive, such as a bonus tied to performance that is paid pursuant to any prior contract, agreement, or promise. The rule also allows for the entire amount of such bonuses to be credited to total annual compensation, thus, increasing the likelihood of capturing highly compensated policy-making individuals across the nation.

The Commission estimates that approximately 92% of workers will fall below this compensation threshold, ensuring that existing non-competes will be unenforceable for the vast majority of workers most likely to experience exploitation and coercion in connection with non-competes.[704] The Commission also estimates that approximately 0.75% of workers are likely to be considered senior executives.[705] The compensation threshold reflects the Commission's finding that non-competes are very rarely bargained for, and to the extent they are, below $151,164 such bargaining is almost non-existent and consideration for a non-compete, if any, is likely to be relatively small. Pairing the compensation threshold with the duties test will also minimize compliance costs, as employers and the Commission will not need to conduct job duties tests for those workers whose compensation fall below the threshold.

i. Definition of ''Total Annual Compensation''

Section 910.1 provides that ''total annual compensation'' is based on the worker's earnings over the preceding year. It is based on DOL's regulation defining ''total annual compensation'' for highly compensated employees in 29 CFR 541.601(b)(1) and matches DOL's determination of what types of compensation can count towards total annual compensation for highly compensated employees.

Section 910.1, like DOL's definition, states that total annual compensation may include salary, commissions, nondiscretionary bonuses and other nondiscretionary compensation earned during that 52-week period. Nondiscretionary bonuses and compensation includes compensation paid pursuant to any prior contract, agreement, or promise, including performance bonuses the terms of which the worker knows and can expect.[706] The definition further states that total annual compensation does not include board, lodging and other facilities as defined in 29 CFR 541.606, and does not include payments for medical insurance, payments for life insurance, contributions to retirement plans and the cost of other similar fringe benefits. Section 541.606 is part of DOL's regulations concerning salary requirements for employees employed in a bona fide executive, administrative, or professional capacity, and applies to

highly compensated employees.[707] That regulation cross-references DOL's regulations on wage payments under the FLSA in 29 CFR part 531, including the term ''other facilities'' defined in 29 CFR 531.32.

This regulatory text makes one modification to the DOL approach to correspond to the final rule's purposes and the non-compete context. Based on comments received, the Commission decided not to adopt DOL's base salary requirement for highly compensated employees in its definition of compensation, which serves a different purpose than the definition adopted here. The 2019 DOL regulation requires that a portion of the worker's total annual compensation must be paid on a salary or fee basis in order to qualify as a highly compensated employee, to ensure that the worker receives at least a base salary and to guard against potential abuses.[708] In contrast, the exception in § 910.2(a)(2) applies only to senior executives. The Commission understands that compensation for senior executives can be structured in many different ways. A law firm commented that senior executive compensation can be particularly complex, as base salary may be 20% or less of a senior executive's annual pay, and much of their pay is variable and does not vest until the end of the year. One comment said some CEOs receive only a $1 salary and receive the rest of their compensation in other forms. The definition of total annual compensation in the final rule is designed to allow for different forms of nondiscretionary compensation without requiring employers to pay a particular amount as salary.

ii. Definition of ''Preceding Year''

The definitions of ''senior executive'' and ''total annual compensation'' in § 910.1 use the term ''preceding year.'' To provide clarity and facilitate compliance, the Commission defines the term ''preceding year'' in § 910.1 as a person's choice among the following time periods: the most recent 52-week year, the most recent calendar year, the most recent fiscal year, or the most recent anniversary of hire year. The term ''preceding year'' is drawn from DOL's FLSA regulations in 29 CFR 541.601(b)(4), which states that ''[t]he employer may utilize any 52-week period as the year, such as a calendar year, a fiscal year, or an anniversary of hire year. If the employer does not identify some other year period in advance, the calendar year will apply.'' Here, the Commission similarly gives employers flexibility to minimize compliance costs, as many employers may have compensation more readily available based on the last calendar year, their fiscal year, or the anniversary of a worker's hire as part of tax and other reporting requirements.

iii. Other Proposed Compensation Thresholds

In seeking to exempt senior executives and highly paid workers from the rule altogether, commenters suggested several possible wage-related thresholds, including specific dollar thresholds (*e.g.,* $100,000) not tied to any existing metric or standard; whether the worker is an hourly worker; annual compensation at or above some multiple of the Federal poverty level or minimum wage, as in New Hampshire, Maine, and Rhode Island statutes; State average wages or ten times the local median wage; and $330,000, the IRS annual compensation limit for 401(k) retirement contributions.[709]

As explained in Part V.D, the Commission declines to exempt workers from the rule altogether based on their earnings. With respect to defining the workers whose *existing* non-competes the Commission exempts, the Commission also declines to use these thresholds or standards. For the reasons described in this Part IV.C.4.b, the Commission believes the compensation threshold it is adopting—in combination with the job duties test it is adopting—most effectively isolates the workers (namely, senior executives) who are likely to bargain with employers and receive compensation for their non-competes and who are unlikely to be exploited or coerced in connection with non-competes. While thresholds based on State lines or metrics would reflect differences in wages and costs of living among States, they would not reflect differences between, for example, urban and rural areas within a State and could generate confusion where the threshold varies between States, in addition to increasing compliance burdens by requiring employers to assess which State adjustment applies—a particularly challenging task in increasingly cross-border and remote work environments. Using the local median wage would generate too much unpredictability for employers and workers and would face the same administrability and confusion challenges to an even higher degree. In contrast, a uniform national compensation threshold as part of the test provides clarity that reduces the risks of *in terrorem* effects and increases ease of compliance. Finally, the $330,000 threshold is an annual compensation limit, while the IRS has a different test to identify highly compensated employees. A $330,000 threshold would be too high for employers in areas with lower average incomes and costs of living and would likely exclude from the definition many senior executives who bargained for their non-compete in exchange for consideration.

One business recommended an exception for individuals in the top 10% income tier at their respective employers to exempt workers at start-ups that might not be able to compensate their workers at a high level but whose workers may still be exposed to trade secrets. Another proposed using Internal Revenue Code section 414(q), defining highly compensated employee as the highest paid 1% or 250 employees in the corporation. A percentage threshold, however, has significant practical issues including workers entering and exiting, earnings changes, and factoring in independent contractors, workers at subsidiaries, or workers at parent companies. It would also lead to disparities between large and small firms, as large firms could use non-competes for far more workers than could small firms.

Other commenters pointed to State laws setting a compensation threshold to support excluding highly paid workers from the final rule or suggested the Commission look to those States as an example. A public policy organization that supported a categorical ban said any threshold should be at least higher than $100,000, citing research on Washington's non-compete reforms that indicated employers did not value non-competes up to that threshold.[710] The compensation threshold the

Commission is adopting is higher than this amount.

c. Defining the Job Duties Component

i. Definitions of ''Officer,'' ''Policy-Making Authority,'' and ''Policy-Making Position''

In NPRM, the Commission suggested that the final rule's definition of senior executive could be based on SEC Rule 3b–7.[711] The Commission did not receive comments specifically addressing this option, but the Commission carefully considered arguments for and against job duties or job title distinctions as well as numerous comments on potential job duties tests, alone or in combination with compensation thresholds, before determining that a modified version of SEC Rule 3b–7's job duties requirements would best meet the exception's goals. The duties test adopted by the Commission is precise and more tailored than the other definitions proposed by commenters[712] and minimizes the risk that workers who likely experienced exploitation and coercion are included in the definition of senior executive. The test focuses primarily on job duties, rather than solely on job titles, because businesses do not all use the same job titles, and a job title might not reflect the worker's actual level of authority in an organization, which is a key indicator of whether a worker is likely to face exploitation and coercion or to have bargained in connection with non-competes.

Section 910.1 defines ''policy-making position'' as a business entity's president, chief executive officer or the equivalent, any other officer of a business entity who has policy-making authority, or any other natural person who has policy-making authority for the business entity similar to an officer with policy-making authority. The definition of ''policy-making position'' further states that an officer of a subsidiary or affiliate of a business entity that is part of a common enterprise who has policy-making authority for the common enterprise may be deemed to have a policy-making position for the business entity for purposes of this paragraph. Finally, the definition of ''policy-making position'' states that a natural person who does not have policy-making authority over a common enterprise may not be deemed to have a policy-making position even if the person has policy-making authority over a subsidiary or affiliate of a business entity that is part of the common enterprise.

Section 910.1 also defines terms used in the definition of ''policy-making position.'' Section 910.1 defines ''officer'' as a president, vice president, secretary, treasurer or principal financial officer, comptroller or principal accounting officer, and any natural person routinely performing corresponding functions with respect to any business entity whether incorporated or unincorporated. To account for differences in the way business entities may use and define job titles, the definition includes workers in equivalent roles. By incorporating this definition of ''officer,'' ''senior executive'' applies to workers at the highest levels of a business entity.

This definition is nearly verbatim of the SEC definition of ''officer'' in 17 CFR 240.3b–2. That term ''officer'' is used in SEC Rule 3b–7.[713] To maintain consistency with the SEC regulations by ensuring that ''officer'' has the same meaning, and to utilize the SEC's expertise in this area, the Commission adopts the SEC's definition of ''officer.''

Section 910.1 defines ''policy-making authority'' as final authority to make policy decisions that control significant aspects of a business entity or a common enterprise. The definition further states that policy-making authority does not include authority limited to advising or exerting influence over such policy decisions or having final authority to make policy decisions for only a subsidiary of or affiliate of a common enterprise.

Accordingly, for a worker to be a senior executive, in addition to meeting the compensation threshold, the worker must be at the level of a president, chief executive officer or the equivalent, officer (defined in § 910.1), or in a position that has similar authority to a president or officer. Further, an officer or other qualifying person must have policy-making authority. Presidents, chief executive officers, and their equivalents are presumed to be senior executives (*i.e.,* employers do not need to consider the further element of ''policy-making authority''). The term ''chief executive officer or the equivalent'' was added to the definition of ''policy-making position'' to increase clarity on who was included and to reflect the wider range of businesses with various structures that are subject to the final rule (as compared to SEC Rule 3b–7). The definition of ''policy-making position'' includes workers with equivalent authority because job titles and specific duties may vary between companies. This ensures that the term ''senior executive'' is broad enough to cover more than just a president or chief executive officer, especially for larger companies, as others may have final policy-making authority over significant aspects of a business entity.

For example, many executives in what is often called the ''C-suite'' will likely be senior executives if they are making decisions that have a significant impact on the business, such as important policies that affect most or all of the business. Partners in a business, such as physician partners of an independent physician practice, would also generally qualify as senior executives under the duties prong, assuming the partners have authority to make policy decisions about the business. The Commission notes that such partners would also likely fall under the sale of business exception in § 910.3 if the partner leaves the practice and sells their shares of the practice. In contrast, a physician who works within a hospital system but does not have policymaking authority over the organization as a whole would not qualify.

The Commission changed some aspects of SEC Rule 3b–7 to fit the context of this rulemaking. First, because § 910.2(a)(2) will extend to non-public companies, unlike SEC regulations, the final rule's definition of ''policy-making position'' does not include the phrase ''any vice president of the registrant in charge of a principal business unit, division or function (such as sales, administration or finance)'' in the definition of ''executive officer.''[714] The Commission believes that in the context of this final rule, in which the definition is relevant to a broader array of entities than public companies, that phrase would encompass workers who, despite their titles, are among those who are likely to be coerced or exploited by non-competes. For example, this aspect of the definition can be too easily applied to managers of small departments, who the Commission finds

[711] 17 CFR 240.3b–7; NPRM at 3520.

[712] *See* Part IV.C.4.c.ii.

[713] 17 CFR 240.3b–7 (''The term executive officer, when used with reference to a registrant, means its president, any vice president of the registrant in charge of a principal business unit, division or function (such as sales, administration or finance), any other officer who performs a policy making function or any other person who performs similar policy making functions for the registrant. Executive officers of subsidiaries may be deemed executive officers of the registrant if they perform such policy making functions for the registrant.''); 17 CFR 240.3b–2 (''The term officer means a president, vice president, secretary, treasury or principal financial officer, comptroller or principal accounting officer, and any person routinely performing corresponding functions with respect to any organization whether incorporated or unincorporated.'').

[714] 17 CFR 240.3b–7.

are unlikely to have bargained for their non-competes. At the same time, a manager who does in fact have policy-making authority would meet the definition of ''officer'' in § 910.1 and thus be included in the definition of senior executives (if the manager also meets the compensation threshold). Similarly, depending on the organization, a vice president may have final policy-making authority over significant aspects of a business entity. The adapted definition is based on functional job duties rather than formal job titles.

Second, SEC Rule 3b–7 uses the term ''policy making function'' as part of its definition of the types of job duties that could classify a person as an ''executive officer.'' [715] While the term ''policy making function'' is undefined in SEC Rule 3b–7 and other SEC regulations, the Commission believes that defining the term ''policy-making authority'' in § 910.1 would provide greater clarity and facilitate compliance with the final rule. The final rule applies to a wider range of business entities than SEC rules, and the Commission seeks to minimize the need to consult with counsel about the meaning of this term. The Commission is also concerned that if the term is left undefined, employers could, inadvertently or otherwise, label too many workers who have any involvement in the employer's policy making as senior executives, especially workers without bargaining power.

In defining this term, the Commission seeks to broadly align with the SEC's definition of ''executive officer'' while focusing on senior executives in a wider variety of entities, who are less likely to experience exploitation and coercion. As explained in Part IV.C.4.b with respect to the compensation threshold, there is no job duties test that will exclude every worker who experiences exploitation and coercion with respect to non-competes while including every worker who does not. Building on the SEC definition provides firms and workers with a more administrable definition that isolates workers at the most senior level of an organization.

To ensure that the final rule's job duties test for senior executives broadly aligns with the SEC definition, the Commission looked to case law interpreting that SEC definition. Few courts have interpreted SEC Rule 3b–7's ''policy making function'' language, though some courts view it as an officer test.[716] In the most in-depth discussion, the U.S. District Court for DC considered a defendant who was a member of a corporate body that discussed important policy decisions and made recommendations to the CEO, and supervised and had ''substantial influence'' over a major aspect of the company's business. However, the court held that only the CEO, and not the defendant, had authority to make company policy and ultimate decisions on significant issues.[717] The court conducted a fact-intensive analysis of the defendant's duties and held that the defendant did not have the authority to make policy. The court also held that the term did not include individuals solely ''involved in discussing company strategy and policy.'' [718]

The Commission finds this case law instructive and thus defines ''policy-making authority'' in the final rule as ''final authority to make policy decisions that control significant aspects of a business entity and does not include authority limited to advising or exerting influence over such policy decisions.'' Adding this definition provides stakeholders with additional clarity as to what type of authority meets the definition of ''senior executive'' and prevents overbroad application of the definition. It expressly does not include workers who merely advise on or influence policy, as a wide range of workers in an organization can advise on or influence policy without being a senior executive.

In order to ensure that lower-level workers, whom the Commission finds likely experience exploitation and coercion, are not included in the definition of senior executive, policy-making authority is assessed based on the business as a whole, not a particular office, department, or other sublevel. It considers the authority a worker has to make policy decisions that control a significant aspect of a business entity without needing a higher-level worker's approval. For example, if the head of a marketing division in a manufacturing firm only makes policy decisions for the marketing division, and those decisions do not control significant aspects of the business (which would likely be decisions that impact the business outside the marketing division), that worker would not be considered a senior executive. Similarly, in the medical context, neither the head of a hospital's surgery practice nor a physician who runs an internal medical practice that is part of a hospital system would be senior executives, assuming they are decision-makers only for their particular division. The definition is limited to the workers with sufficient pay and authority such that they are more likely to have meaningful bargaining power and actually negotiated their non-competes.

For the same reason, the Commission added language to the definitions of ''policy-making authority'' and ''policy-making position'' to exclude from the definition of ''senior executives'' workers with policy-making authority over only a subsidiary or affiliate of a common enterprise who do not have policy-making authority over the common enterprise. One commenter argued that the proposed definition of ''business entity'' would allow firms to divide themselves into separate entities to evade the final rule. In addition to sharing this concern, the Commission is concerned that executives of subsidiaries or affiliates of a common enterprise [719] could rely on their final authority to make policy decisions for only that subsidiary or affiliate to classify the head of each office as a senior executive even though that individual only has authority over one component of a coordinated common enterprise. Rather, the worker must have policy-making authority with respect to the common enterprise as a whole, not just a segment of it, to be a senior executive. Workers who head a subsidiary or affiliate of a common enterprise are similar to department heads; the senior executives controlling the entire common enterprise control those individual subsidiaries and affiliates. As the Commission has explained, the Commission finds that department heads and other highly paid non-senior executives do not have sufficient bargaining power to avoid exploitation and coercion and are unlikely to have bargained in connection with non-competes. The job duties test identifies the workers with the highest levels of authority in an organization, *i.e.,* the workers most likely to have bargaining power and a bespoke, negotiated agreement, and a

[718] *Id.* at 136.

[719] *FTC* v. *WV Universal Mgmt., LLC,* 877 F.3d 1234, 1240 (11th Cir. 2017) (''[C]ourts have justly imposed joint and several liability where a common enterprise exists'').

common enterprise is effectively a single organization. Such workers may have a senior executive job title, but they are unlikely to meet the job duties test.

To be considered a ''common enterprise'' for the purposes of defining policy-making authority and policy-making position, the Commission looks beyond legal corporate entities to whether there is a common enterprise of ''integrated business entities.'' [720] This means that the various components of the common enterprise have, for example, one or more of the following characteristics: maintain officers, directors, and workers in common; operate under common control; share offices; commingle funds; and share advertising and marketing.[721] Therefore, the definitions of policy-making authority and policy-making position include provisions whose purpose is to exclude those executives of a subsidiary or affiliate of a common enterprise from being considered senior executives. For example, if a business operates in several States and its operations in each State are organized as their own corporation, assuming these businesses and the parent company meet the criteria for a common enterprise, the head of each State corporation would not be a senior executive. Rather, only the senior executives of the parent company (or whichever company is making policy decisions for the common enterprise) could qualify as senior executives for purposes of this final rule, because they are the workers with the highest level of authority in the organization and most likely to have bargaining power and a bespoke, negotiated agreement. However, a worker could qualify as a senior executive even if they were an executive of one or more subsidiaries or affiliates of the common enterprise, so long as that senior executive exercised policy-making authority over the common enterprise in its entirety. These provisions are consistent with the approach taken elsewhere in this final rule to focus on real-world implications and authority rather than formal titles, labels, or designations. This exclusion from the definitions of ''policy-making authority'' and ''policy-making position'' applies only to common enterprises; for subsidiaries or affiliates that are not part of a common enterprise, a worker could qualify as a senior executive if they have policy-making authority over that subsidiary or affiliate and meet all of the requirements.

The Commission has also substituted ''business entity'' in the definitions of ''officer'' and ''policy-making position'' where SEC Rule 3b–7 uses the word ''registrant'' and 17 CFR 240.3b–2 uses ''organization,'' because ''registrant'' has a specific meaning in the SEC context that is inapplicable to the wider array of business entities covered by this final rule and because ''business entity'' is defined in § 910.1 and is used throughout this final rule. The Commission substituted ''natural person'' where SEC Rule 3b–7 and 17 CFR 240.3b–2 use ''person'' because ''person'' is separately defined for purposes of this final rule in § 910.1.

ii. Other Proposed Job Duties Tests

The FLSA

Numerous commenters suggested basing a job duties test on the categories of occupations that are exempt from requirements under the FLSA. Some commenters suggested using only some of the exemptions such as executive employees,[722] administrative employees, learned or creative professionals, or workers in the practice of medicine.[723] DOL's regulations also set a salary threshold at not less than $684 per week ($35,568 annually),[724] though other commenters suggested using a higher compensation threshold.

One civic organization opposed applying any FLSA exemptions, stating that the FLSA provides numerous exemptions that do not relate to any non-compete policy considerations, and an exception or more lenient standards for FLSA-exempt workers would not solve the problems caused by non-competes. It opposed using the FLSA's executive, administrative, or professional exemptions, arguing that updates to the FLSA's salary threshold are often delayed and outdated, often falling below the poverty threshold, and the duties test serves as a loophole for wage and hour protections.

Commenters offered several reasons for adopting the FLSA exemptions: these categories are already well-established in Federal law; nonexempt workers under the FLSA tend not to have access to trade secrets or be able to take an employer's goodwill and are thus less likely to harm the employer; the exemptions would capture both wage and job duties tests; some States use a similar standard to the FLSA in their non-compete statutes; and the exemptions would ban non-competes for low-skilled workers for whom there are insufficient justifications for non-competes. An employment attorney also pushed back on the NPRM's concerns that the FLSA exemptions could enable misclassification,[725] asserting that misclassification under the FLSA is unlawful and penalized, and thus usually inadvertent.

The Commission does not adopt the FLSA exemptions for purposes of this final rule because it would exempt millions of non-competes that harm competition and workers. For example, the FLSA exempts most highly paid and highly skilled workers,[726] who the Commission finds experience exploitation and coercion (except where those workers are also senior executives).[727] The Commission also adopts brighter-line rules than the FLSA to ease compliance burdens and address *in terrorem* effects that result from uncertainty about whether a non-compete is unenforceable.[728] Although the Commission does not believe that the FLSA job duties tests are appropriate for this final rule, it does view the FLSA wage threshold methodology for ''highly compensated employees'' as a useful benchmark.[729]

Trade Secret and Confidential Information Exceptions

Numerous commenters urged the Commission not to ban non-competes for workers who have access to trade secrets and confidential information, often noting this justification is commonly used for highly paid and highly skilled workers, including senior executives. One comment expressly stated that this exception should apply regardless of earnings, though many

[728] *See* Part IX.C.

[729] *See* Part IV.C.4.b.

others did not mention compensation thresholds. One business suggested a bright-line rule for the types of confidential business information that can be protected by a non-compete based on existing State statutes, to increase certainty about what is allowed. Commenters suggested exceptions based on a variety of job types they viewed as more likely to be exposed to trade secrets and confidential information, including all highly skilled workers; key scientific, technical, R&D, or sales workers; or workers with highly detailed knowledge of business and marketing plans. The Commission explains why it is not adopting exceptions based on access to trade secrets or other intellectual property in Parts V.D.1 and V.D.2.

Additional Proposed Job Duties and Job Title Tests

The Commission carefully considered several other proposed tests. The NPRM stated that the Commission could base the definition of senior executive on SEC Regulation S–K's definition of senior executives.[730] Commenters did not discuss this potential option. The Commission is not adopting this approach because it bears little relation to the likelihood that a senior executive bargained for a non-compete, and because it would designate roughly seven individuals per company as ''senior executives'' regardless of their compensation level or the size of the company, meaning it would not apply equally among employers or workers.[731] For example, a ten-person company could potentially use non-competes for most of its workforce irrespective of whether they are senior executives, whereas a company with ten thousand employees would be limited to the same number.[732]

One commenter proposed adopting a definition similar to the tax code provision on ''golden parachute payments.'' [733] Several commenters drafted their own definition of senior executive based on job duties, titles, or ownership status, such as C-suite executives and their immediate subordinates, partners and equity holders, managers, workers involved in strategic decision-making, and more.

The Commission carefully considered each proposed definition and how it would operate in practice before selecting the two-part test. Elements of some of these proposals, such as strategy development or decision-making, are also similar to the job duties test the Commission is finalizing. The Commission believes that definitions based on job titles alone would be inadequate because, as one industry association commented, employers define job titles differently, and a title might not accurately reflect a worker's job duties. The other definitions proposed by commenters, such as the provision on golden parachute payments, would generally require a more fact-intensive analysis than the job duties test the Commission is adopting. Market participants would need to conduct the analysis for more workers, including workers who are exploited and coerced by non-competes. A more fact-intensive analysis would require more resources for litigation and is thus likely to have *in terrorem* effects for lower-wage workers.[734] Moreover, many of these proposals would exempt more workers than the Commission's definition, such as managers, even though workers in such roles and occupations are often coerced and exploited by non-competes.

As explained in this Part, the Commission pairs a relatively easy-to-apply job duties test with a compensation threshold to maximize administrability and clarity while identifying those senior executives most likely to have bargained for non-competes. In addition, proposals to except partners, shareholders, and similar groups are likely covered by the sale of business exception if they sell their share of the business upon leaving.

5. Prohibitions in Section 910.2(a)(2)

Based on the totality of the evidence, including its review of the empirical literature, its review of the full comment record, and its expertise in identifying practices that harm competition, the Commission adopts § 910.2(a)(2), which defines unfair methods of competition related to non-competes with respect to senior executives. Section 910.2(a)(2) provides that, with respect to a senior executive, it is an unfair method of competition for a person: (i) to enter into or attempt to enter into a non-compete clause; (ii) to enforce or attempt to enforce a non-compete clause entered into after the effective date; or (iii) to represent that the senior executive is subject to a non-compete clause, where the non-compete clause was entered into after the effective date. Part IV.A.1 sets forth the Commission's determination that the foregoing practices are unfair methods of competition under section 5, and Part IV.C.2 explains the findings that provide the basis for this determination.

Section 910.2(a)(2) uses similar language as § 910.2(a)(1); however, there are two key differences. First, the prohibition in § 910.2(a)(2)(ii) on enforcing or attempting to enforce a non-compete applies only to non-competes entered into after the effective date. Second, the prohibition in § 910.2(a)(2)(iii) on representing that a senior executive is subject to a non-compete applies only where the non-compete was entered into after the effective date. Sections 910.2(a)(2)(ii) and (iii) include this language because, for the reasons described in Part IV.C.3, the Commission has determined not to prohibit existing non-competes with senior executives—*i.e.,* non-competes entered into before the effective date—from remaining in effect.

Otherwise, the explanation of the three prongs of § 910.2(a)(1) in Part IV.B.4—relating to issues such as, for example, what ''attempt to enter into'' and ''attempt to enforce'' mean, and what conduct the ''representation'' prong applies to—is applicable to the corresponding language in § 910.2(a)(2). The good-faith exception in § 910.3 is also applicable to the relevant prohibitions with respect to senior executives and is explained in Part V.C.

D. Claimed Justifications for Non-Competes Do Not Alter the Commission's Finding That Non-Competes Are an Unfair Method of Competition

For the reasons described in Parts IV.B and IV.C, the Commission determines that certain practices related to non-competes are unfair methods of competition under section 5. In this Part IV.D, the Commission finds the claimed justifications for non-competes do not alter the Commission's determination that non-competes are an unfair method of competition.

As noted in Part II.F, some courts have declined to consider justifications altogether and the Commission and courts have consistently held that pecuniary benefit to the party responsible for the conduct in question

[730] *See* NPRM at 3520 (citing 17 CFR 229.402(a)(3)).

[731] *See* 17 CFR 229.402(a)(3).

[732] Additionally, while the reporting obligations of public companies may provide them with an incentive to avoid generating a profusion of ''senior executives,'' privately held companies would not face a similar constraint and could potentially avoid any ''per-company'' limitations through corporate restructuring.

[733] This provision determines who is an ''officer'' ''on the basis of all the facts and circumstances in the particular case (such as the source of the individual's authority, the term for which the individual is elected or appointed, and the nature and extent of the individual's duties) . . . .'' Treas. Reg. sec. 1.280G–1, Q/A–18.

[734] *See* Part IX.C.

is not cognizable as a justification.[735] However, where defendants raise justifications as an affirmative defense, they must be legally cognizable,[736] and non-pretextual,[737] and any restriction used to bring about the benefit must be narrowly tailored to limit any adverse impact on competitive conditions.[738]

In the NPRM, the Commission considered the commonly cited business justifications for non-competes and preliminarily found they did not alter the Commission's determination that non-competes are an unfair method of competition.[739] The Commission has reviewed and considered the comments on its analysis of the justifications for non-competes. For two reasons, the claimed justifications for non-competes do not alter the Commission's determination that non-competes are an unfair method of competition. First, employers have more narrowly tailored alternatives to non-competes for protecting valuable investments that tend to negatively affect competitive conditions to a lesser degree. Second, the asserted benefits from the claimed business justifications from non-competes do not justify the considerable harm from non-competes.

1. Claimed Business Justifications for Non-Competes and Empirical Evidence

Claimed business justifications for non-competes relate to increasing employers' incentives to make productive investments, such as investments in worker human capital (worker training), client and customer attraction and retention, or in creating or sharing trade secrets or other confidential information with workers. According to these asserted justifications, without non-competes, employment relationships are subject to an investment hold-up problem. Investment hold-up would occur where an employer—faced with the possibility that a worker may depart after receiving some sort of valuable investment or obtaining valuable information—opts not to make that investment in the first place, thereby decreasing the firm's productivity and overall social welfare. For example, according to this claimed justification, an employer may be more reticent to make capital investments or invest in workers' human capital by training its workers if it knows the worker may depart for or may establish a competing firm. Similarly, commenters argued that employers may decrease investments or experience harm if a worker takes a trade secret or other confidential information to a competitor.

Courts have cited these justifications when upholding non-competes under State common law and in cases challenging non-competes under the Sherman Act.[740] However, courts have not considered non-competes' aggregate harms, and neither legislatures nor courts have had occasion to consider these justifications in the context of section 5. The Commission has considered them and found them unavailing in cases in which it has successfully obtained consent decrees against non-competes alleged to be an unfair method of competition in violation of section 5.[741]

There is some empirical evidence that non-competes increase investment in human capital of workers, capital investment, and R&D investment. However, the Commission also finds that there are alternatives that burden competition to a lesser degree,[742] and, in any event, these claimed benefits do not justify the harms from non-competes.[743]

As explained in the NPRM, a study by Evan Starr finds that moving from mean non-compete enforceability to no non-compete enforceability would decrease the number of workers receiving training by 14.7% in occupations that use non-competes at a high rate (relative to a control group of occupations that use non-competes at a low rate).[744] The study further finds that changes in training are primarily due to changes in firm-sponsored, rather than employee-sponsored, training.[745]

Firm-sponsored training is the type of investment in human capital that non-competes are often theorized to protect, as the firm may be unwilling to make an unprotected investment. However, the study does not distinguish between core training, *i.e.,* training required to perform job duties, and advanced training, *i.e.,* training with potential to increase productivity beyond the baseline requirements for job performance. When non-competes are more enforceable, workers may receive additional core training rather than advanced training, but this may actually reflect a reduction in efficiency. When non-competes are more enforceable, labor mobility decreases and workers may also move to new industries to avoid potentially triggering non-compete clause violations (as discussed in Part IV.B.2.b.ii), both of which make experienced workers less often available for hire. Firms therefore may need to train workers at a greater rate because they will hire inexperienced workers who require more core training. On the other hand, advanced training can be associated with productivity gains, and firms using non-competes may increase rates of advanced training for experienced workers because non-competes increase the likelihood that firms receive a return on the training investment. The study does not distinguish between these types of training, and thus leaves unclear whether the observed increases in training reflect productivity gains or losses (or neither in net).

Additionally, the Starr study uses data on the use of non-competes, comparing high- and low-use occupations, rather than changes in enforceability; however, the study does not examine differences between individuals who are bound by non-

competes and individuals who are not. This study is the only study that attempts to identify the causal link between non-competes and worker human capital investment, and the Commission gives it some weight, though not as much weight as it would receive if it examined changes in non-compete enforceability. The Commission also weights it less highly because it does not distinguish between core and advanced training.

The second study, by Jessica Jeffers, finds knowledge-intensive firms invest substantially less in capital equipment following decreases in the enforceability of non-competes, though the effect is much more muted (and statistically insignificant) when considering all industries.[746] While firms may invest in capital equipment for many different reasons, Jeffers examines this outcome (as opposed to labor-focused outcomes) to avoid looking at R&D expenditure as a whole, which is in large part composed of labor expenses. This allows the study to isolate the effects of non-compete enforceability on investment from other effects of non-competes, such as reduced worker earnings.

Jeffers finds that there are likely two mechanisms driving these effects: first, that firms may be more likely to invest in capital when they train their workers because worker training and capital expenditure are complementary (*i.e.,* the return on investment in capital equipment is greater when workers are more highly trained); and second, that non-competes reduce competition, and firms' returns to capital expenditure are greater when competition is lower, incentivizing firms to invest more in capital.[747] Jeffers does not find any impact of non-compete enforceability on R&D expenditure (intangible investment). The sample in this study's examination of capital investment is limited to incumbent firms, and the study also finds decreases in new firm entry due to increases in non-compete enforceability. The study therefore does not offer clear insights into the overall net effect on capital investment (which includes investment by incumbent firms as well as investment by entering firms). Additionally, the Commission notes that if Jeffers' hypothesis—that firms increase investment in capital because of decreased competition—is correct, then this increased capital investment may not necessarily reflect increased economic efficiency. Jeffers uses multiple changes in non-compete enforceability, measured in a binary fashion, and the Commission therefore gives this study substantial weight, but less weight than studies which additionally measure enforceability in a non-binary fashion.

Two studies published after the release of the NPRM also assess the effects of non-competes on firm investments. A study by Johnson, Lipsitz, and Pei revisits the form of the regressions used by Jeffers. The authors find that greater non-compete enforceability increases R&D expenditure.[748] This is consistent with the NPRM's preliminary finding, and the finding of the Jeffers study, that there is evidence that non-competes increase employee human capital investment and other forms of investment. The Commission gives this study substantial weight because it examines multiple changes in non-compete enforceability measured in a non-binary fashion.

Similarly, a study by Liyan Shi examines the relationship between non-compete enforceability, the use of non-competes among executives, and firm investment.[749] Shi finds that intangible capital (expenditure on R&D) is positively associated with use of non-competes, especially in States that enforce non-competes more strictly. However, Shi finds that—unlike in the Jeffers study—physical capital expenditure has no relationship with the use of non-competes, even in high enforceability States. The Commission notes that this evidence pertains specifically to non-competes with highly paid senior executives: the executives in Shi's study earned $770,000 in cash compensation, on average. The Commission also notes that this evidence arises from analysis of non-compete use coupled with non-compete enforceability. The Commission therefore gives less weight to these empirical findings.

As the NPRM described, there are also two studies examining the impact of non-compete use (as opposed to non-compete enforceability) on investment. However, these studies simply compare differences between samples of workers that do and do not use non-competes, a methodology the Commission gives less weight to.[750] The first is a study by Starr, Prescott, and Bishara using their 2014 survey of non-compete use. They find no statistically significant association with either training or the sharing of trade secrets (after inclusion of control variables) but do not examine other investment outcomes.[751] The second study, by Johnson and Lipsitz, examines investment in the hair salon industry. That study finds that firms that use non-competes train their employees at a higher rate and invest in customer attraction through the use of digital coupons (on so-called ''deal sites'') to attract customers at a higher rate, both by 11 percentage points.[752]

As the Commission stated in the NPRM, it gives these two studies (the 2021 Starr, Prescott, and Bishara studies and the 2021 Johnson and Lipsitz studies) minimal weight, because they do not necessarily represent causal relationships, a point recognized by the authors of both of these studies.[753] Similar to other studies of non-compete use—as opposed to changes in non-compete enforceability—these studies are less reliable because the use of non-competes and the decision to invest may be jointly determined by other characteristics of the firms, labor markets, or product markets.[754]

One additional study, by Younge and Marx, finds that the value of publicly traded firms increased by 9% due to an increase in non-compete enforceability.[755] As the Commission noted in the NPRM, the authors attribute this increase to the value of retaining employees, which comes with the negative effects to parties other than the firm (employees, competitors, and consumers) described in Parts IV.B and IV.C. As the NPRM stated, if the benefits to the firm arise primarily from reductions in labor costs, then the increase in the value of firms is in part a transfer from workers to firms and is therefore not necessarily a benefit of non-competes. However, the authors do not explore the extent to which increases in firm value arise from decreases in labor costs. The authors additionally note that since the time frame used in the study is short, ''there may be deleterious effects of non-competes in the long run'' which are absent in their findings.[756] This study

[746] Jeffers, *supra* note 450 at 28. Jeffers reports 34%–39% increases in capital investment due to increases in non-compete enforceability at knowledge-intensive firms in the 2024 version of the study, and the Commission calculates increases of 7.9% across all sectors (see Part X.F.9.a.i).

does not address the effects of non-competes on firm investments specifically.

As the Commission stated in the NPRM, it is unaware of any evidence of a relationship between the enforceability of non-competes and the rate at which companies invest in creating or sharing trade secrets.[757] Similarly, the Commission is unaware of any evidence non-competes reduce trade secret misappropriation or the loss of other types of confidential information, difficult areas for researchers to study given the lack of reliable data on firms' trade secrets and confidential information.[758] As explained in Part IV.D.2, even assuming non-competes do reduce misappropriation or information loss, the Commission finds that there are alternatives to protect these investments that burden competition to a lesser degree.

2. Employers Have Alternatives to Non-Competes for Protecting Valuable Investments

a. The Proposed Rule

In the NPRM, the Commission preliminarily found that employers have alternatives to non-competes for protecting valuable investments.[759] The Commission stated that these alternatives may not be as protective as employers would like, but they reasonably accomplish the same purposes as non-competes while burdening competition to a less significant degree.[760]

The Commission stated that trade secret law—a form of intellectual property law that protects confidential business information—already provides significant legal protections for an employer's trade secrets.[761] The Commission also stated that employers that seek to protect valuable investments are able to enter into NDAs with their workers. NDAs, which are also commonly known as confidentiality agreements, are contracts in which a party agrees not to disclose or use information designated as confidential.[762] The Commission further stated that, if an employer wants to prevent a worker from leaving right after receiving valuable investment in their human capital, the employer can sign the worker to an employment contract with a fixed duration.[763] In addition, the Commission stated that employers that wish to retain their workers can also pay their workers more, offer them better hours or better working conditions, or otherwise improve the conditions of their employment—*i.e.,* compete to retain their labor services.[764]

The Commission also noted that in three States—California, North Dakota, and Oklahoma—employers generally cannot enforce non-competes, so they must protect their investments using one or more of these less restrictive alternatives.[765] The Commission stated that the economic success in these three States of industries that are highly dependent on trade secrets and other confidential information illustrates that companies have viable alternatives to non-competes for protecting valuable investments.[766]

b. The Commission's Final Findings

Based on the totality of the evidence, including its review of the empirical literature, its review of the full comment record, and its expertise in identifying practices that harm competition, the Commission in this final rule finds that the asserted business justifications for non-competes do not alter the Commission's determination that non-competes are an unfair method of competition. Employers have alternatives to non-competes for protecting valuable investments that burden competition to a less significant degree. Rather than restraining a broad scope of beneficial competitive activity—by barring workers altogether from leaving work with the employer or starting a business and by barring competing employers and businesses from hiring those workers—these alternatives are much more narrowly tailored to limit impacts on competitive conditions.

For the protection of trade secrets and other confidential information, these alternatives include enforcement of intellectual property rights under trade secret and patent law, NDAs, and invention assignment agreements. Employers also have alternative mechanisms to protect their investments in worker human capital, including fixed duration contracts, and competing on the merits to retain workers by providing better pay and working conditions.

The experiences of certain States in banning non-competes bolster this conclusion. Non-competes have been void in California, North Dakota, and Oklahoma since the 1800s.[767] In these three States, employers generally cannot enforce non-competes, so they must protect their investments using one or more less restrictive alternatives. There is no evidence that employers in these States have been unable to protect their investments (whether in human capital, physical capital, intangible assets, or otherwise) or have been disincentivized from making them to any discernible degree. Rather, in each of these States, industries that depend on highly trained workers and trade secrets and other confidential information have flourished. California, for example, is home to four of the world's ten largest companies by market capitalization, and it also maintains a vibrant startup culture.[768] Technology firms are highly dependent on highly-trained and skilled workers as well as protecting trade secrets and other confidential information—and, since the 1980s, California has become the epicenter of the global technology sector, even though employers cannot enforce non-competes.[769] Indeed, researchers have posited that high-tech clusters in California may have been aided by increased labor mobility due to the unenforceability of non-competes.[770] In

[757] Recent evidence suggests that trade secret litigation does not increase following bans on non-competes. Brad N. Greenwood, Bruce Kobayashi, Evan Starr, *Can You Keep a Secret? Banning Noncompetes Does Not Increase Trade Secret Litigation* (2024), *https://papers.ssrn.com/sol3/papers.cfm?abstract_id=4771171*. The Commission does not rely on this study to support the findings described in this Part IV.D.

North Dakota and Oklahoma, the energy industry has thrived, and firms in the energy industry depend on highly-trained workers as well as the ability to protect trade secrets and other confidential information.

The Commission finds that the economic success in these three States of industries that are highly dependent on highly trained workers, trade secrets, and other confidential information illustrates that non-competes are not necessary to protect employers' legitimate interests in trained workers or securing their intellectual property and confidential information. These alternatives are available to employers and viable both with respect to senior executives and to workers other than senior executives. The Commission addresses these alternatives in this Part IV.D.2.b and summarizes and responds to the comments on these alternatives in Part IV.D.2.c.

i. Trade Secret Law

The Commission finds that trade secret law provides employers with a viable, well-established means of protecting investments in trade secrets, without the need to resort to the use of non-competes with their attendant harms to competition. Trade secret law is a form of intellectual property law that is specifically focused on providing employers with the ability to protect their investments in trade secrets.[771]

Forty-seven States and DC have adopted the Uniform Trade Secrets Act (''UTSA'').[772] The UTSA provides a civil cause of action for trade secret misappropriation, which refers to disclosure or use of a trade secret by a former employee without express or implied consent.[773] The UTSA also provides for injunctive and monetary relief, including compensatory damages, punitive damages, and attorney's fees.[774]

In addition, in 2016, Congress enacted the Defend Trade Secrets Act of 2016 (''DTSA''), which established a civil cause of action under Federal law for trade secret misappropriation.[775] The DTSA brought the rights of trade secret owners ''into alignment with those long enjoyed by owners of other forms of intellectual property, including copyrights, patents, and trademarks.'' [776] Similar to State laws modeled on the UTSA, the DTSA authorizes civil remedies for trade secret misappropriation, including injunctive relief, damages (including punitive damages), and attorney's fees.[777] The DTSA also authorizes a court, in ''extraordinary circumstances,'' to issue civil ex parte orders for the ''seizure of property necessary to prevent the propagation or dissemination of the trade secret that is the subject of the action.'' [778] There is thus a clear Federal statutory protection that specifically governs protection of trade secrets.

Trade secret theft is also a Federal crime. The Economic Espionage Act of 1996 (''EEA'') makes it a Federal crime to steal a trade secret for either (1) the benefit of a foreign entity (''economic espionage'') or (2) the economic benefit of anyone other than the owner (''theft of trade secrets'').[779] The EEA authorizes substantial criminal fines and penalties for these crimes.[780] The EEA further authorizes criminal or civil forfeiture, including of ''any property constituting or derived from any proceeds obtained directly or indirectly as a result of'' an EEA offense.[781] The EEA also requires offenders to pay restitution to victims of trade secret theft.[782]

Under the UTSA, DTSA, and EEA, the term ''trade secret'' is defined expansively and includes a wide range of confidential information.[783] The viability of trade secret law as a means for redressing trade secret theft is illustrated by the fact that firms regularly bring claims under trade secret law. A recent analysis by the legal analytics firm Lex Machina finds that 1,156 trade secret lawsuits were filed in Federal court in 2022.[784] In addition, an analysis by the law firm Morrison Foerster finds that 1,103 trade secret cases were filed in State courts in 2019.[785] The number of cases filed in State court has held steady since 2015, when 1,161 cases were filed.[786] The fact that a considerable number of trade secret lawsuits are filed in Federal and State courts—over 2,200 cases per year—and the fact that this number has held relatively steady for several years suggests that many employers themselves view trade secret law as a viable means of obtaining redress for trade secret theft.

The use of trade secret law burdens competition to a lesser degree than the use of non-competes. Trade secret law provides firms with a viable means of redressing trade secret misappropriation—and deterring trade secret misappropriation by workers—without blocking beneficial competitive activity, such as workers switching to jobs in which they can be more productive or starting their own businesses.

ii. NDAs

NDAs provide employers with another well-established, viable means for protecting valuable investments.[787]

[786] *Id.* at n.5.

[787] The Commission uses the term ''NDA'' to refer to contractual provisions that are designed to protect trade secrets or other business information that has economic value. Employers may also seek to use NDAs to protect other kinds of information, such as information about discrimination, harassment, sexual assault, corporate wrongdoing, or information that may disparage the company or its executives or employees. These types of NDAs have been widely criticized for, among other things, their pernicious effects on workers. *See, e.g.,* Rachel S. Arnow-Richman et al., *Supporting Market Accountability, Workplace Equity, and Fair Competition by Reining In Non-Disclosure Agreements,* UC-Hastings Research Paper 2–6 (Jan. 2022), *https://papers.ssrn.com/sol3/.?abstract_=.*

NDAs are contracts in which a party agrees not to disclose and/or use information designated as confidential. If a worker violates an NDA, the worker may be liable for breach of contract.[788] Employers regularly use NDAs to protect trade secrets and other confidential business information. Researchers estimate that between 33% and 57% of U.S. workers are subject to at least one NDA.[789] One study finds that 95.6% of workers with non-competes are also subject to an NDA; 97.5% of workers with non-competes are also subject to a non-solicitation agreement, NDA, or a non-recruitment agreement; and 74.7% of workers with non-competes are subject to all three provisions.[790] In most States, NDAs are more enforceable than non-competes.[791] While some commenters argued that NDAs would not be an adequate alternative to non-competes because of the NPRM's proposed functional definition of ''non-compete clause,'' the final rule will not prevent employers from adopting garden-variety NDAs; rather, it prohibits only NDAs that are so overbroad as to function to prevent a worker from seeking or accepting employment or operating a business.[792]

Appropriately tailored NDAs burden competition to a lesser degree than non-competes. Such NDAs may prevent workers from disclosing or using certain information, but they generally do not prevent workers from seeking or accepting other work, or starting their own business, after their employment ends. As the Tenth Circuit has stated, workers subject to NDAs, unlike workers subject to non-competes, ''remain free to work for whomever they wish, wherever they wish, and at whatever they wish,'' subject only to the terms that prohibit them from disclosing or using certain information.[793]

iii. Other Means of Protecting Valuable Investments

The Commission finds that employers have additional well-established means of protecting valuable investments in addition to trade secret law and NDAs. For the protection of trade secrets and other confidential information, the Commission finds that these additional means include patent law and invention assignment agreements. Patent law provides inventors with the right, for a certain period of time, to exclude others from making, using, offering for sale, or selling an invention or importing it into the U.S.[794] During the period when patent protection is effective, patents grant the patent holder these exclusive rights, while other firms may use trade secrets if they are independently developed, reverse-engineered, or inadvertently disclosed.[795] In some cases, however, firms may choose to keep their invention a trade secret rather than seeking a patent because patent protection only lasts a certain number of years, after which the invention becomes part of the public domain.[796] Where a technology, process, design, or formula is able to meet the rigorous standards for patentability, patent law provides companies with a less restrictive alternative than non-competes for protecting it.[797]

Employers can further protect their property interests in these forms of intellectual property through appropriately tailored invention assignment agreements. These are agreements that give the employer certain rights to inventions created by the employee during their employment with a firm.[798] Like patent law, this tool, when appropriately tailored, provides employers with additional protection for some of their most valuable intellectual property interests.

With respect to investments in worker human capital, the Commission finds that these less restrictive alternatives include fixed duration contracts and competing on the merits to retain workers. If an employer wants to prevent a worker from leaving right after receiving valuable training, the employer can sign the worker to an employment contract with a fixed duration. An employer can establish a term that is long enough for the employer to recoup its human capital investment, without restricting who the worker can work for, or their ability to start a business, after their employment ends. In doing so, the employer makes a commitment to the worker and vice versa.

Finally, instead of using non-competes to lock in workers, the Commission finds that employers that wish to retain their workers can also compete on the merits for the worker's labor services—*i.e.,* they can provide a better job than competing employers by paying their workers more, offering them better hours or better working conditions, or otherwise improving the conditions or desirability of their employment. These are all viable tools for protecting human capital investments and other investments an employer may make that do not rely on suppressing competition.

c. Comments and Responses to Comments

Many commenters agreed with the Commission's preliminary finding that employers have less restrictive alternatives to non-competes. These commenters asserted that trade secret law, combined with NDAs, creates a powerful deterrent to post-employment disclosures of trade secrets and confidential information, and that these tools adequately protect valuable investments in the absence of non-competes. The Commission agrees with these commenters. Other commenters asserted that the alternatives to non-competes identified in the NPRM are inadequate for protecting employer investments. The Commission summarizes and responds to the comments it received on less restrictive alternatives in this Part IV.D.2.c.

i. Comments and Responses to Comments on Trade Secrets and Other Confidential Information

Several commenters who generally supported the proposed rule stated that trade secret law and NDAs offer meaningful enforcement advantages to employers compared with non-competes. A few commenters stated that, unlike non-competes, trade secret law and NDAs are broadly enforceable in all fifty States. A few commenters stated that, while monetary penalties for breaching non-competes are ordinarily difficult to obtain, employers can obtain substantial monetary recovery for trade secret law and NDA violations. The Commission agrees with these comments.

Several commenters stated that the scope of trade secret law is limited in various respects. Several commenters stated, for example, that customer lists, pricing, and bid development information are typically excluded from the definition of ''trade secret'' under the DTSA and the law of many States.

[798] *See, e.g., Milliken & Co.* v. *Morin,* 731 SE2d 288, 294–95 (S.C. 2012); *Revere Transducers, Inc.* v. *Deere & Co.,* 595 NW2d 751, 759–60 (Iowa 1999); *Ingersoll-Rand Co.* v. *Ciavatta,* 542 A.2d 879, 886–87 (N.J. 1988).

In response to these comments, the Commission notes that customer information may be classified as trade secrets under certain circumstances, such as when the information is not generally known or not otherwise easy to obtain and when a firm has taken measures to protect the confidentiality of the information.[799] Employers may also use NDAs to protect such information. NDAs broadly protect all information defined as confidential, regardless of whether such information constitutes a ''trade secret'' under State or Federal law.[800]

Some commenters argued that other tools under intellectual property law, such as patent and trademark law, are inadequate to protect employers' investments. These commenters misinterpret the Commission's findings. The Commission did not find in the NPRM, nor does it find in this final rule, that patent law standing alone or trademark law standing alone provide employers benefits equal to the benefits they may reap from an unfair method of competition, namely the use of non-competes. Rather, the Commission finds that patent law can be used, together with the other tools the Commission cites, including NDAs and fixed-term employment contracts, to protect legitimate investments in intellectual property and worker human capital investment and therefore that these tools, taken together, are viable alternatives to non-competes.

A number of commenters stated that there are enforceability disadvantages to trade secret law and NDAs compared to non-competes. Several commenters stated that trade secret law and NDAs are inadequate to protect employer investments prophylactically because employers can enforce them only after the trade secrets or other confidential information have already been disclosed. These commenters stated that trade secrets and confidential information can be highly valuable, and its value could be destroyed as soon as a worker discloses such information to a competing employer. Additionally, some commenters argued that trade secret law and NDAs are inadequate to protect employers' investments because enforcement outcomes for trade secrets and NDAs are less predictable and certain than with non-competes. Some comments suggested that this purported clarity of non-competes benefits workers, arguing that non-competes offer bright lines workers can follow to ensure against unintended violations. Other commenters assert that non-competes themselves are not necessarily effective as a prophylactic remedy, because it is often unclear whether a particular non-compete is enforceable, and non-competes are difficult to enforce in many jurisdictions. A few commenters stated that prophylactic remedies are already available under trade secret law in almost half of U.S. States where the doctrine of inevitable disclosure is recognized, while other commenters were concerned that not all States recognize the doctrine. Other commenters argued the inevitable disclosure doctrine may be worse for workers, and one commenter argued that the final rule would increase the use of the inevitable disclosure doctrine and thus reduce worker mobility.

Some commenters stated that prophylactic remedies are necessary to adequately protect trade secrets and confidential information because workers can exploit their former employers' trade secrets and confidential information without ever disclosing the information themselves, thus leaving aggrieved employers with no recourse under trade secret law or an NDA. Specifically, these commenters argued that when workers take new roles, they will inevitably use their knowledge of former employers' confidential information. For example, where a worker has experience with attempts and failures to develop new ideas or products with a former employer, they will likely use this knowledge to prevent a new employer from making similar mistakes, thus free riding off the former employer's development efforts, costs, and time. A commenter argued that preventing non-competes from restricting this type of misappropriation would discourage investment and harm innovation in the long run.

The Commission believes that what some commenters describe as the ''prophylactic'' benefits of non-competes—that an employer can block a worker from taking another job, without respect to any alleged misconduct—is also the source of their overbreadth because it enables employers to restrict competition in both labor markets and product and service markets, as detailed in Parts IV.B and IV.C. That employers prefer to wield non-competes as a blunt instrument on top of or in lieu of the specific legal tools designed to protect legitimate investments in intellectual property and other investments cannot justify an unfair method of competition. The Commission also disagrees that banning non-competes would discourage investment and would harm innovation in the long run. As discussed in Part IV.B.3.b.ii, the Commission finds that the weight of the evidence indicates that non-competes reduce innovation by preventing workers from starting businesses in which they can pursue innovative new ideas; inhibiting efficient matching between workers and firms (making it less likely that workers match with firms that can maximize their talent and productivity); and decreasing the cross-pollination of ideas.

Additionally, the Commission notes that non-compete agreements themselves cannot be said to provide ironclad ''prophylactic'' protections against disclosure of trade secrets and other confidential information. As other commenters point out, in the absence of this rule, it is often unclear whether and to what extent a specific non-compete is enforceable, and they are difficult to enforce in many jurisdictions. Moreover, non-competes do not prevent the worker from disclosing trade secrets or confidential information after the end of the non-compete period or outside of the clause's geographic restriction. The Commission also notes that, as a few commenters stated, prophylactic remedies are already available under trade secret law in almost half of U.S. States where the doctrine of inevitable disclosure is recognized.[801]

Several commenters argued that detecting and proving violations of NDAs and trade secret law is more

[799] *See U.S. West Commc'ns, Inc.* v. *Off. of Consumer Advoc.,* 498 NW2d 711, 714 (Iowa 1993) (''business information may . . . fall within the definition of a trade secret, including such matters as maintenance of data on customer lists and needs . . .''); *Guy Carpenter & Co.* v. *Provenzale,* 334 F.3d 459, 467 (5th Cir. 2003) (''A customer list may be a trade secret, but not all customer lists are trade secrets under Texas law. The broader rule of trade secrets, that they must be *secret,* applies to customer lists''); *Home Paramount Pest Control Cos.* v. *FMC Corporation/Agricultural Prods. Group,* 107 F. Supp. 2d 684, 692 (D. Md. 2000) (''There is no question that a customer list can constitute a trade secret.''); *Liebert Corp.* v. *Mazur,* 827 NE2d 909, 922 (2005) (''[W]hether customer lists are trade secrets depends on the facts of each case.'').

[800] *See, e.g., Tendeka, Inc.* v. *Glover,* No. CIV.A. H–13–1764, 2015 WL 2212601 at *14 (S.D. Tex. May 11, 2015).

[801] In some States, under the ''inevitable disclosure doctrine,'' courts may enjoin a worker from working for a competitor of the worker's employer where it is ''inevitable'' the worker will disclose trade secrets in the performance of the worker's job duties. *See, e.g., PepsiCo, Inc.* v. *Redmond,* 54 F.3d 1262, 1269, 1272 (7th Cir. 1995). The inevitable disclosure doctrine is controversial. Several States have declined to adopt it altogether, citing the doctrine's harsh effects on worker mobility. *See Bayer Corp.* v. *Roche Molecular Sys., Inc.,* 72 F. Supp. 2d 1111, 1120 (N.D. Cal. 1999); *LeJeune* v. *Coin Acceptors, Inc.,* 849 A.2d 451, 470–71 (Md. 2004). Other States have required employers to meet high evidentiary burdens related to inevitability, irreparable harm, and bad faith before issuing an injunction pursuant to the doctrine. *See generally* Eleanore R. Godfrey, *Inevitable Disclosure of Trade Secrets: Employee Mobility* v. *Employer Rights,* 3. J. High Tech. L. 161 (2004).

difficult than for non-competes, and that enforcement is accordingly more expensive, because it is more difficult to detect and obtain evidence of the disclosure or use of confidential information than it is to determine that a former worker has moved to a competitor. Some commenters asserted that trade secret litigation is expensive because the cases are fact-intensive and involve litigating multiple challenging issues. Some commenters argued that as a result, the proposed rule conflicted with Congressional intent underlying the DTSA. A few commenters similarly argued that breaches of non-solicitation agreements are difficult to detect and can be enforced only after the solicitation has occurred. While the Commission recognizes that trade secrets litigation and NDA and non-solicitation enforcement may be more costly than non-compete enforcement in some instances, the Commission is not persuaded that higher costs associated with alternative tools make those tools inadequate. The comments do not establish that pursuing remedies through trade secrets litigation or NDA enforcement are prohibitively expensive. In any event, the Commission and courts have consistently held that pecuniary benefit to the party responsible for the conduct in question is not cognizable as a justification.[802] While employers may find that protecting trade secrets and confidential information or customer relationships by using non-competes to restrict worker mobility, regardless of whether that worker would misappropriate confidential information or solicit customers, is easier for them, the Commission finds that same overbreadth of non-competes imposes significant negative externalities on workers, consumers, businesses, and competition as a whole.[803] This overbreadth that employers benefit from wielding is what causes the harms from non-competes relative to more narrowly-tailored alternatives.

Some commenters contended that higher burdens for establishing violations of trade secret and IP laws will harm employer incentives to share trade secrets with workers and to invest in valuable skills training. The Commission is not persuaded that higher evidentiary burdens render trade secret law and NDAs inadequate for protecting employers' valuable investments. Heightened standards are a valuable mechanism to filter out overbroad restrictions on beneficial competitive activity. The comment record is replete with examples of workers bound by non-competes who lacked knowledge of trade secrets or whose employment with a competitor never threatened their previous employer's investments. To the extent trade secret law and NDAs require higher evidentiary showings, that makes these alternatives more tailored tools for protecting employers' valuable investments without unduly restricting a worker from engaging in competitive activity.

Some commenters argued that, without non-competes, employers would limit access to valuable trade secrets within the workplace because trade secret law requires employers to show reasonable efforts to maintain the secrecy of an alleged trade secret to prove a violation, and that reduced rates of intrafirm trade secrets sharing will ultimately harm innovation as well as workers. In response, the Commission notes that the empirical evidence indicates otherwise: when non-competes are more enforceable, the overall level of innovation decreases.[804] Furthermore, these comments seem to overstate the burden of reasonable efforts to keep information secret. Under the DTSA, courts have found that employers meet this requirement by sharing information at issue only among workers bound by NDAs or maintaining such information in password-protected digital spaces.[805] Accordingly, assertions that employers will need to take extraordinary precautions to maintain secrecy over trade secrets and confidential information are inconsistent with standards courts typically recognize for determining whether reasonable efforts were taken to keep such information confidential. The Commission is not persuaded that requirements in trade secret law to show reasonable efforts to maintain secrecy will deter intrafirm information sharing, or otherwise make alternative tools inadequate.

Several commenters argued that the Commission should not find that employers have adequate alternatives to protecting their valuable investments because there is a lack of empirical evidence specifically showing that trade secret law and NDAs are effective for the purpose of protecting trade secrets and confidential information. In response, the Commission notes that trade secret law is a body of law that is specifically designed to protect the interests being asserted; employers consistently bring cases under this body of law; and a preference among firms for a blunter instrument for protecting trade secrets and confidential information cannot justify an unfair method of competition that imposes significant negative externalities on workers, other firms, consumers, and the economy.[806] An industry trade organization commenter stated that neither fixed-duration employment contracts nor improved pay, benefits, or working conditions specifically protect against the disclosure of confidential information. In response, the Commission notes that firms can protect against the disclosure of confidential information using trade secret law and NDAs, and, where applicable, patent law and invention assignment agreements. And in response to these commenters, the Commission notes that companies in California, North Dakota, and Oklahoma have been able to protect their trade secrets and other confidential information adequately using tools other than non-competes since the late nineteenth century. Industries that are highly dependent on trade secrets and other confidential information have flourished in those States even though non-competes have been unenforceable.

A few commenters disputed the NPRM's contention that the rate at which employers pursue trade secrets litigation is evidence of the viability of trade secret law as a means for redressing trade secret theft or protecting confidential information, in part because those employers were not necessarily relying exclusively on trade secret law. The Commission does not assert that these data, alone, conclusively establish trade secret law is a perfect vehicle for redressing trade secret theft. Rather, the data show trade secret litigation is more than a mere theoretical possibility—it is an avenue many companies choose to redress trade secret theft and indeed it is the body of law designed and developed for this very purpose. Accordingly, the Commission believes that the fact that many companies bring claims under the well-established body of State and Federal law on trade secrets is relevant evidence that trade secret law provides a viable means for redressing trade secret theft.

Some commenters suggested a higher volume of trade secrets litigation in California may reflect a higher rate of trade secret disclosure due to the State's policy against enforcing non-competes. However, these commenters did not

[802] *See supra* note 305 and accompanying text.

[803] *See* Parts IV.B and IV.C.

[804] *See* Part IV.B.3.b.ii.

[805] *See e.g., In re Adegoke,* 632 B.R. 154, 167 (Bankr. N.D. Ill. 2021); *Houser* v. *Feldman,* 569 F. Supp. 3d 216, 230 n.7 (E.D. Pa. 2021); *AvidAir Helicopter Supply, Inc.* v. *Rolls-Royce Corp.,* 663 F.3d 966, 974 (8th Cir. 2011).

[806] *See* Parts IV.B. and IV.C (describing the negative externalities from non-competes).

provide evidence to support this hypothesis. The Commission also notes industries in California that depend on protecting trade secrets have thrived despite the inability to enforce non-competes; indeed, the State is the capital of the global technology industry. Therefore, regardless of whether there is a higher rate of trade secret litigation in California, the less restrictive alternatives identified in this Part IV.D have provided sufficient protection to enable these companies to grow, thrive, and innovate. Furthermore, the rate of trade secret litigation in California may result from factors unique to California's economy, such as California's high concentration of technology companies relative to other States. As such, the Commission does not believe there is credible evidence to suggest trade secrets are disclosed at a higher rate in California than in other jurisdictions.[807]

Many commenters agreed with the Commission's preliminary conclusion that the economic success in California, North Dakota, and Oklahoma of industries highly dependent on trade secrets and other confidential information illustrates that companies have viable alternatives to non-competes for protecting valuable investments. In contrast, a few commenters argued that the Commission mischaracterized California's non-compete ban because they claim that California permits non-competes to protect trade secrets, citing dicta from the 1965 California Supreme Court case *Muggill* v. *Reuben H. Donnelley Corp.*[808] However, the Commission is unaware of any cases in which a California court has actually upheld a non-compete agreement under California law based on the dicta in this opinion, and commenters do not point to any.[809] To the contrary, California courts have consistently refused to enforce non-competes even where employers alleged they were needed to protect trade secrets.[810]

Another commenter argued that California's experience does not necessarily demonstrate anything about the effect of banning non-competes because California employers impose non-competes at rates comparable to other States. In response, the Commission notes that while Starr, Prescott, and Bishara state that workers are covered by non-competes at ''roughly the same rate'' in States where non-competes are unenforceable and enforceable,[811] when the authors control for employee characteristics to compare ''observationally equivalent employees,'' they find that non-competes are less common (by 4–5 percentage points) in nonenforcing States compared to States that permit vigorous enforcement of non-competes.[812] Additionally, California, North Dakota, and Oklahoma are still distinct from other States because employers may not actually enforce non-competes, even if employers in those States continue to enter into them.

A commenter argued that the Commission misattributes California's success in the technology industry and North Dakota's and Oklahoma's success in the energy industry to their non-compete laws, rather than the presence of top universities and venture capital firms in the State (in the case of California) or of abundant natural resources in the State (in the case of North Dakota and Oklahoma). The Commission believes that this commenter mischaracterizes its analysis. The Commission does not attribute California's success in the technology industry and North Dakota's and Oklahoma's success in the energy industry to their non-compete laws. The Commission merely notes that these industries are highly dependent on protecting trade secrets and having highly trained workers, and that these industries have thrived in these States despite the inability of employers to enforce non-competes.

One commenter argued that there are no alternatives that adequately protect employers' legitimate interests because other restrictive employment agreements do not sweep as broadly as non-competes. In this Part IV.D, the Commission concludes that less restrictive alternatives such as trade secret law, IP law, and NDAs are adequate to protect trade secrets and other confidential information even where they do not sweep as broadly as non-competes. Indeed, the Commission believes that non-competes are overbroad with respect to protecting trade secrets and other confidential information, because they enable employers to restrict a wide swath of beneficial competitive activity without respect to any alleged misconduct. That employers prefer to wield non-competes as a blunt instrument on top of or in lieu of the specific legal tools designed to protect legitimate investments in intellectual property and other investments cannot justify an unfair method of competition.

ii. Comments and Responses to Comments on Human and Physical Capital Investment

Several commenters addressed the evidence concerning the effects of non-competes on human capital investment and other investment. Several commenters asserted that, even if non-competes increased human capital investment, they still left workers worse off because they suppressed workers' mobility and wages overall. Workers and worker advocates also argued that workers lose the value of their skills and human capital investment when non-competes force them to sit out of the workforce, and non-competes can decrease their incentive to engage in human capital investment since they cannot capitalize on their skills and knowledge. These commenters stated that many workers, particularly highly skilled workers, have had some form of education prior to working for their employer, diminishing any potential need for non-competes to protect the employers' human capital investment. For example, many physicians pointed out that they had to go through medical school, residency, internships, and/or fellowships—significant investments that they made, not their employers.

Some commenters questioned the link between increased human capital investment and non-compete enforcement, arguing that employer human capital investment will still be provided without non-competes. Other commenters also stated that prohibiting non-competes would make it easier for firms to hire trained workers, because it would be easier for them to switch jobs. More generally, one advocacy organization said that employers frequently make investments that do not work out and should not place the risk of that investment onto their workers. A commenter who discussed physician non-competes argued that investment-based justifications for non-competes overestimate the value added by employers while failing to recognize the value physicians bring to employers.

Some businesses and trade organizations argued that employers invest significant time and money into training workers who lack the specific skills needed for the job. These commenters stated that, without non-competes, employers risk the worker taking that investment to a competitor. Some commenters state that this risk is

greatest in underserved areas and when there are worker shortages. Several commenters said that employment restrictions such as non-competes incentivize businesses to pay for credentials, training, and advanced education that low-wage and other workers would be unable to afford on their own, facilitating upward mobility. For highly educated workers, such as physicians, some employers said they need non-competes to protect payments for continuing education as well as mentorships and on the job training. Businesses and their advocates asserted that in some industries, many new employees are unprofitable for a significant period, requiring up-front investment and training from employers who want to recoup that investment.

In response, the Commission notes that, as described in Part IV.D.2.b.iii, firms have less restrictive alternatives for protecting human capital investments, including fixed-duration contracts and competing on the merits for the worker's labor services through better pay, benefits, or working conditions. Through these means, employers can retain workers without restricting who they can work for, or their ability to start a business, after their employment ends. The Commission also notes that these commenters often inaccurately describe the increased labor mobility afforded by the final rule as a one-way street. While it will be easier under the final rule for workers to switch jobs and work for a competitor, it will also be easier for firms to hire talented workers, since those workers are not subject to non-competes. In general, firms will benefit from access to a wider pool of labor, because the rule eliminates the friction non-competes impose on the free functioning of competition in labor markets. Whether this will be a net benefit to a particular firm, or not, will depend on the firm's ability to compete for workers on the merits to attract and retain talent.

A group of healthcare policy researchers stated that the investment justifications offered by corporate owners of physician practices are misleading since the true value of the investment in the practice is the book of business and referrals. These researchers suggested that non-competes are used to circumvent laws that prohibit payment for physician referrals. The Commission notes that this comment aligns with a statement by researcher Kurt Lavetti at the Commission's 2020 forum on non-competes. Lavetti stated that patient referrals are a valuable asset, but buying or selling those referrals is illegal, so non-competes are a secondary method of protecting that asset.[813]

Commenters also stated that non-competes protect investments other than in human capital, capital expenditures, and R&D, including recruiting and hiring, providing client and customer service, facilities, marketing, and technology, among others. The Commission is unaware of any empirical evidence showing that non-competes increase these types of investments, and commenters did not provide any. In general, however, firms can protect investments in trade secrets and confidential information, and investments in workers, through the less restrictive alternatives described in Part IV.D.2.b.

Two trade organizations stated that prohibiting non-competes could cause businesses to lose staff, and that losing staff could cause them to reduce investments that may be based on staffing assumptions. These commenters did not provide empirical evidence to support these arguments. The Commission also notes that firms would not necessarily lose workers because of the final rule. As described previously, some firms may lose workers because it will be easier for workers to leave for better opportunities, while some firms may gain workers by attracting workers from other firms. Additionally, firms can retain workers by competing on the merits for their labor services—*i.e.,* by offering better jobs than their competitors.

Commenters asserted that Starr, Prescott, and Bishara[814] found that notice of non-competes alongside a job offer is positively correlated with training compared to later notice. In response, the Commission notes that the evidence is a correlation between early notice and training, not a causal finding, so the Commission gives it minimal weight. In addition, regardless of whether there is an increase in training where notice of non-competes is provided along with the job offer instead of later on, this data is not salient on the question of whether employers have less restrictive alternatives to protecting training investments.

A few commenters stated non-competes protect against the ''disclosure'' of general trade knowledge and skills, while the less restrictive alternatives cited in the NPRM do not. Relatedly, some commenters argued prohibiting non-competes and broadly enabling workers to take general trade knowledge and skills to competitors will mean that their new employers will free ride off investments the former employers made in their human capital, which will discourage future investment in human capital. The Commission does not believe preventing workers from using their general trade knowledge and skills, including their gains in trade knowledge and skills through experience with a particular employer, is a legally cognizable or legitimate justification for non-competes. Under State common law, preventing a worker from using their general knowledge and skills with another employer is not a legitimate interest that can justify a non-compete.[815] Indeed, there is a general principle in the law of restrictive employment agreements—and trade secret law as well—that these tools cannot be used to prevent workers from using their general trade knowledge and skills.[816] The Commission does not view the inability to prevent disclosure or use of general skills and knowledge as a shortcoming of trade secret law and NDAs; instead, it considers the use of general skills and knowledge as beneficial competitive activity. Moreover, the Commission notes that sectoral job training strategies can be a tool for employers and workers to access worker training that is transferrable across employers.[817]

One commenter asserted trade secret law and NDAs are inadequate to protect employers' goodwill, while another commenter asserted these tools are inadequate to protect investments in relationships with clients. Regarding whether trade secret law and NDAs are adequate to protect employers' client relationships, the Commission interprets this to refer to employers' concern that a client will follow a worker to a competitor. The Commission believes that employers have alternatives for protecting these investments, including fixed-duration contracts (in the case of goodwill), NDAs (in the case of client lists), and competing on the merits to retain workers and/or clients. Firms can seek to protect client relationships by offering superior service and value—through the free and fair functioning of competition. These more narrowly

tailored alternatives reasonably protect the applicable interest while burdening competition to a lesser degree because they do not restrict the worker's ability to seek or accept work or start a business after their employment ends. Therefore, while trade secret law and NDAs may not protect goodwill or client relationships, the Commission finds that employers have adequate alternative tools to protect these interests. Furthermore, the Commission notes the final rule does not restrict employers from using trade secret law and NDAs in tandem—along with other alternatives—to protect their investments, and comments maintaining that employers lack adequate alternatives to non-competes because the commenter views just one of these mechanisms as inadequate are unpersuasive.

A commenter argued the final rule may implicate the ability of Federal contractors to provide letters of commitment, which are often required by government agencies and require contractors to identify key personnel who will work on an awarded contract, sometimes for years in the future. In response, the Commission notes that contractors have alternatives to non-competes to retain key personnel, including by using fixed-term employment contracts or providing the key personnel a better job than competitors.

A commenter stated that fixed-duration employment contracts are not necessarily effective at protecting human capital investments because employers may not know at the time of hiring when they will be providing training to a worker. This commenter also stated that improving the pay, benefits, and working conditions of workers is not necessarily an effective means for protecting human capital investments. In response, the Commission notes employers may enter into fixed-duration employment contracts with their workers at any time, not just at the outset of the employment relationship. It further notes competing to retain a trained worker will not work in every instance, but it is an important option available to employers and the provision of training can itself be a competitive differentiator for an employer.

A commenter also asserted California has the highest cost of living and, if this is attributable to the absence of non-competes, the proposed rule could risk increasing the cost of living nationwide. The commenter did not provide evidence to support the existence of an inverse relationship between non-compete enforceability and cost of living, and the Commission is aware of no such evidence. The Commission thus does not believe that there is a basis to conclude the final rule would increase the cost of living nationwide.

iii. Comments Regarding Alternatives to Non-Competes for Senior Executives

Commenters offered the same justifications for non-competes with senior executives: that they increase employers' incentive to make productive investments. However, many commenters argued senior executives are more likely than other workers to have knowledge of trade secrets and other competitively sensitive information or to have customer relationships and thus non-competes for senior executives are necessary, and other tools such as trade secret law and NDAs are not viable alternatives.

In response, the Commission finds that these tools—trade secret law, NDAs, patents, and invention assignment agreements—provide viable means of protecting valuable investments against disclosure by senior executives, just as they do for all other workers. Commenters do not identify any reasons why senior executives are uniquely situated with respect to these less restrictive alternatives—*i.e.,* why trade secret law or NDAs may not adequately protect firm investments from disclosure by senior executives specifically—and the Commission is not aware of any such reasons.

Some commenters argued non-competes with executives and high-wage workers promote competition because they encourage innovation in businesses by providing investors with more confidence that executives will not share trade secrets with competitors, decreasing competition. An industry organization asserted that non-competes allow executives to share ideas and business decisions with other workers within the business and collaborate to make strategic decisions. A commenter stated that an executive leaving to start a competing product could also delay the timeline for both the former employer's product and the competing product. As noted previously, the Commission does not believe there is reliable empirical data on the relationship between non-competes and disclosure of confidential information, but employers have alternatives to protect such information. Further, the empirical evidence shows non-competes overall inhibit innovation on the output side; therefore, to the extent any of these effects are occurring, they are more than outweighed by the negative effects of non-competes on innovation.[818]

According to some commenters, an executive moving to a competitor could unfairly advantage the competitor and irreparably harm the former employer. In response, the Commission notes that there is nothing inherently unfair about an executive moving to a competitor, particularly if this results from competition on the merits (such as the competitor paying more or otherwise making a more attractive offer). If companies seek to retain their executives, they have other means for doing so—such as increasing the executives' compensation or entering fixed-duration contracts—that do not impose significant negative externalities on other workers and on consumers, as non-competes do.[819]

Some commenters also said senior executives may have more client, business partner, and customer relationships than other employees and may contribute substantially to a firm's goodwill. The Commission believes that employers have alternatives for protecting goodwill and client/customer relationships. For example, if a firm wants to keep a worker from departing and taking goodwill or clients or customers with them, it can enter a fixed-duration contract with the worker, otherwise seek to retain the worker through competition on the merits, or seek to retain the client/customer through competition on the merits.

An accountant with experience analyzing executive non-competes for business valuations said such valuations are calculated based on the potential harm if the executive violated the non-compete. In addition, some commenters argued non-competes for senior executives and other important workers increase the value of firms in mergers and acquisitions because they ensure such valuable workers stay after the sale. An investment industry organization said investors seek to ensure the right workers who know the business stay and run the newly acquired business. In addition, that organization said some institutional investors may require contracts retaining key workers.

In response, the Commission notes that valuation of senior executive non-competes in such contexts is part of the reason the Commission is allowing such existing senior executive non-competes to remain in force.[820] In future

[818] *See* Part IV.B.3.b.ii.

[819] *See* Part IV.C.2 (describing the negative externalities of non-competes for senior executives).

[820] *See* Part IV.C.3.

transactions, businesses and investors have other methods of incentivizing senior executives and other workers to remain, including fixed duration contracts and competing to retain workers on the merits, and thereby enhancing the value of firms and transactions—methods that do not impose such significant externalities on other workers and consumers.

Some industry organizations said non-competes increase employer investment in management and leadership training for executives. An investment industry organization said non-competes allow senior executives to access training and experience for their own benefit and the benefit of investors in the firm. In response, the Commission notes that employers have alternative mechanisms to protect their investments in worker training, including fixed-duration contracts and improved compensation.

Some commenters argued that non-competes may improve executive performance, as some executives have non-competes tied to deferred compensation and other future benefits, which encourages long-term value creation by incentivizing executives to focus on long-term rather than short-term gains. A law firm said that forfeiture-for-competition clauses are an important component of deferred compensation agreements, and deferred compensation incentivizes long-term value-building and penalizes, via reduction or forfeiture, harm to the business, which the commenter said includes working for a competitor. The commenter claimed that if forfeiture-for-competition clauses are banned, firms would shift some of the deferred compensation to more short-term awards, which would in turn increase risk-taking and decrease overall wealth accumulation. The commenter cited a review by the Federal Reserve after the 2008 financial crisis which found that deferred compensation can mitigate executive risk-taking activities.[821] It also cited other Federal agencies and court decisions recognizing the value of deferred compensation to mitigate risk. Separately, the firm argued that without forfeiture-for-competition clauses, an executive who moves to a competitor will compete less against their former employer so as not to devalue their equity award, thus degrading competition. Commenters also contended that State courts have recognized forfeiture-for-competition clauses to be reasonable and that some State statutes governing non-competes carve them out.

In response, the Commission recognizes that many existing deferred compensation contracts may have been negotiated to include non-competes or forfeiture-for-competition clauses that may not be easily separated, and the final rule allows existing senior executive non-competes to remain in force.[822] However, the Commission is not persuaded that non-competes are necessary for future deferred compensation agreements. The Federal Reserve study on the value of deferred compensation does not mention non-competes or forfeiture-for-competition clauses. While the study states that clawback provisions may discourage specific types of behavior, it notes that they do not affect most risk-related decisions.[823] The commenter did not explain why non-competes are necessary for deferred compensation to reduce risk-taking or how post-employment competition could impact performance while at the firm. The commenter also did not explain why firms would forgo the benefits of deferred compensation even without a forfeiture-for-competition clause. The commenter separately argued that an executive who moves to a competitor will be conflicted and compete less against their former employer so as not to devalue their equity award. The comment framed this as an anticompetitive problem akin to interlocking directorates under the Clayton Act, as it could increase collusion (though the commenter provided no support for this argument). The commenter did not, however, explain why an executive would move to a competitor if doing so would devalue their own equity. The Commission also does not believe that the solution to this type of anticompetitive behavior, even if it were to occur, is to further restrict competition by blocking the executive from moving to the competitor in the first place.

Some commenters argued that forfeiture-for-competition clauses, which are sometimes attached to deferred compensation arrangements, were also justified. Some commenters contended that workers subject to forfeiture-for-competition clauses who choose to work for a competitor are likely to be compensated by the competitor for whom they will be working. Separately, a law firm and an investment industry organization stated that it would be unfair for companies to continue making deferred compensation or other payments to former workers who now work for a competitor if forfeiture-for-competition clauses were banned. A law firm also stated that forfeiture-for-competition clauses allow senior executives to retire without losing their deferred compensation, which in turn clears a path for younger workers to move up, while protecting senior executives' retirement benefits. In response, the Commission notes that pre-existing agreements for senior executives are not banned under the final rule.[824] The Commission also sees no reason why deferred compensation, including for retiring workers, cannot be used without forfeiture-for-competition clauses.

Some commenters stated that the study by Kini, Williams, and Yin, discussed in the NPRM with respect to senior executive earnings,[825] finds that CEOs with non-competes are more frequently forced to resign their position. Commenters note that Kini, Williams, and Yin also find that CEO contracts more closely align the incentives of executives (with respect to stock prices and risk taking) with shareholders when the executives have non-competes or when those non-competes are more enforceable. In response, the Commission notes that, as indicated by commenters, this study examines the use of non-competes in conjunction with their enforceability. The Commission therefore finds that the results may not reflect a causal relationship. For example, the use of non-competes and the propensity of the board to force an executive to resign may be jointly determined by the strength of the relationship or the trust between management and the board, rather than the use of non-competes causing forced turnover. The Commission also notes that—as shown in the study—there are other methods by which boards may encourage executives to perform, such as by structuring financial incentives to encourage or discourage risk taking, according to the preferences of the board. Boards can also fire poorly performing executives even without non-competes.

One commenter said that a ban on non-competes may encourage U.S. companies to relocate their executive teams outside the U.S. in order to continue using non-competes. The

[821] *See* Bd. of Govs. of the Fed. Reserve Sys., *Incentive Compensation Practices: A Report on the Horizontal Review of Practices at Large Banking Organizations* (Oct. 2011), *https://www.federalreserve.gov/publications/other-reports//incentive-compensation-practices-report-201110.pdf*.

[824] *See* § 910.2(a)(2).

[825] *See* Kini, Williams, & Yin, *supra* note 83.

commenter did not provide specific evidence to support this assertion. The Commission believes that firms' decisions on where to locate their executive teams are likely influenced by a multitude of factors other than whether the firm may or may not use non-competes.

3. The Asserted Benefits From These Justifications Do Not Justify the Harms From Non-Competes

a. The Commission's Final Findings

Based on the totality of the evidence, including its review of the empirical literature, its review of the full comment record, and its expertise in identifying practices that harm competition, the Commission in this final rule finds that the claimed business justifications for non-competes do not justify the harms from non-competes—for either senior executives or for workers other than senior executives, whether considered together or separately—because the evidence indicates that increasing enforceability of non-competes has a net negative impact along a variety of measures. Whether the benefits from a practice outweigh the harms is not necessarily an element of section 5,[826] but, in any event, the benefits from the justifications cited in Part IV.D.1 clearly do not justify the harms from non-competes.

Not all the harms from non-competes are readily susceptible to monetization.[827] However, even the quantifiable harms from non-competes are substantial and clearly not justified by the purported benefits. Non-competes cause considerable harm to competition in labor markets and product and service markets. Non-competes obstruct competition in labor markets because they inhibit optimal matches from being made between employers and workers across the labor force through the process of competition on the merits for labor services. The available evidence indicates that increased enforceability of non-competes substantially suppresses workers' earnings, on average, across the labor force generally and for specific types of workers.[828]

In addition to the evidence showing that non-competes reduce earnings for workers across the labor force, there is also evidence that non-competes reduce earnings specifically for workers who are not subject to non-competes.[829] These workers are harmed by non-competes, because their wages are depressed, but they do not necessarily benefit from any purported incentives for increased human capital investment that non-competes may provide. Overall, these harms to labor markets are significant. The Commission estimates the final rule will increase workers' total earnings by an estimated $400 billion to $488 billion over ten years, at the ten-year present discounted value.[830]

The available evidence also indicates non-competes negatively affect competition in product and service markets. The weight of the evidence indicates non-competes have a negative impact on new business formation and innovation.[831] There is evidence that non-competes increase consumer prices and concentration in the health care sector.[832] There is also evidence non-competes foreclose the ability of competitors to access talent.[833] While available data do not allow for precise quantification of some of these effects, they are nonetheless substantial: the Commission estimates that the rule will reduce spending on physician services over ten years by $74–194 billion in present discounted value, will result in thousands to tens of thousands of additional patents per year, and will increase in the rate of new firm formation by 2.7%.[834]

In the Commission's view, the asserted benefits from non-competes do not justify their harms. Even if the businesses using non-competes benefit, pecuniary benefits to the party undertaking the unfair method of competition are not a sufficient justification under section 5.[835] As described in Part IV.D.1, the most commonly cited justifications for non-competes are that they increase employers' incentive to make productive investments in, for example, trade secrets, customer lists, and human and physical capital investment. There is some evidence that non-competes increase human and physical capital investment, as noted previously.[836] However, the empirical literature does not show the extent to which human capital investment and other investment benefits from non-competes accrue to any party besides the employer, and to the extent it addresses this issue it suggests otherwise. For example, in theory, if increased human capital investment from non-competes benefited workers, they would likely have higher earnings when non-competes are more readily available to firms (*i.e.,* when legal enforceability of non-competes increases). However, as explained in Parts IV.B.3.a.ii and IV.C.2.c.ii, the empirical evidence indicates that, on net, greater enforceability of non-competes reduces workers' earnings. Likewise, in theory, if increased human capital investment increased innovation that redounds to the benefit of the economy and society as a whole, one would expect to see legal enforceability of non-competes yield such benefits, but as elaborated in Part IV, the empirical evidence on innovation effects indicates the opposite.

Moreover, the Commission is also not aware of any evidence that these potential benefits of non-competes lead to reduced prices. Indeed, the only empirical study of the effects of non-competes on consumer prices—in the health care sector—finds increased prices as the enforceability of non-competes increases.[837] That study, which finds that non-compete enforceability increased physician pay, also finds that labor cost pass-through is not driving price decreases.[838]

Furthermore, there is no evidence that, in the three States in which non-competes are generally void, the inability to enforce non-competes has materially harmed employers, consumers, innovation (or economic conditions more generally), or workers. As a result, the Commission finds that the asserted benefits from non-competes do not justify the harms they cause.

The Commission finds that the harms from non-competes are clearly not justified by the purported benefits, regardless of whether one considers senior executives or workers other than senior executives together or separately. In this Part IV.D.3, the Commission explains why, for workers overall, the asserted benefits from non-competes do not justify the harms they cause. This is at least as true for senior executives as for other workers. As described in Part IV.C.2.c.i, non-competes with senior executives tend to negatively affect competitive conditions in product and service markets at least as much as non-competes with other workers—and likely to a greater extent—given the outsized role of senior executives in forming new businesses, serving on new

[826] *See* Part II.F (stating that the inquiry as to whether conduct tends to negatively affect competitive conditions focuses on the nature and tendency of the conduct and does not require a detailed economic analysis).

businesses' executive teams, and setting the strategic direction of businesses with respect to innovation. At the same time, firms have the same less restrictive alternatives available for senior executives as they do for other workers, as described in Part IV.D.2.c.iii. For these reasons, whether one considers non-competes with senior executives or non-competes with other workers, the claimed business justifications for non-competes do not justify the harms from non-competes.

b. Responses to Comments

Commenters focused on the question of whether employers have adequate alternatives to non-competes and the analysis of costs and benefits of the proposed rule in the preliminary regulatory impact analysis, rather than the balancing analysis discussed in this Part IV.D.3 specifically. These comments are addressed in Part IV.D.2 and in Part X, respectively.

E. Section 910.2(b): Notice Requirement for Existing Non-Competes

The Commission proposed to require employers to rescind (*i.e.,* legally modify) existing non-competes and provide notice to inform workers that they are no longer bound by existing non-competes.[839] Based on comments, the Commission is not adopting a rescission requirement in the final rule. Rather than require employers to legally modify existing non-competes, the final rule prohibits employers from enforcing existing non-competes with workers other than senior executives after the compliance date.

The final rule adopts the notice requirement—for workers who are not senior executives—with minor revisions to facilitate compliance and to improve the likelihood of workers being meaningfully informed. The revisions include an option for employers to make the notice more accessible to workers who speak a language other than English. The final rule also simplifies compliance and ensures that workers have prompt notice that their non-competes are no longer in force by requiring employers to provide notice by the effective date, rather than 45 days thereafter.

1. The Proposed Rule

Proposed § 910.2(b)(1) would have required employers to rescind existing non-competes with all workers. Proposed § 910.2(b)(2) would have required employers that rescinded non-competes to provide notice to the affected workers that their non-compete is no longer in effect and may not be enforced.

As proposed, § 910.2(b)(2) had three subparagraphs that imposed various requirements related to the notice. Proposed § 910.2(b)(2)(i) stated that an employer that rescinds a non-compete pursuant to § 910.2(b)(1) must provide notice in an individualized communication to the worker that the worker's non-compete is no longer in effect and may not be enforced. The Commission stated in the NPRM that an employer could not satisfy the notice requirement by, for example, posting a notice at the employer's workplace.[840] Proposed § 910.2(b)(2)(i) also stated that the employer must provide the notice in writing on paper or in a digital format such as an email or text message within 45 days of rescinding the non-compete.

Proposed § 910.2(b)(2)(ii) stated that the employer must provide the notice to both current workers and former workers when the employer has the former worker's contact information readily available. To ease the burden of compliance, proposed § 910.2(b)(2)(iii) provided model language that would satisfy the notice requirement. Proposed § 910.2(b)(2)(iii) and § 910.2(b)(3) provided a safe harbor for employers using the model language, while also permitting an employer to use different language, provided that the language communicates to the worker that the worker's non-compete is no longer in effect and may not be enforced.[841]

In the NPRM, the Commission stated that the purpose of the proposed notice requirement was to ensure that workers are informed that their existing non-competes are no longer in effect. The Commission cited evidence indicating that many workers are not aware of the applicable law governing non-competes or their rights under those laws, and stated that it was therefore concerned that, absent a notice requirement, workers may not know that their non-competes are no longer enforceable as of the effective date.[842]

2. The Final Rule

a. The Final Rule Does Not Require Rescission (Legal Modification) of Existing Non-Competes

The Commission has eliminated the proposed rule's requirement that employers rescind (*i.e.,* legally modify) existing non-competes. The Commission believes the proposed rescission requirement would have imposed unnecessary burdens on employers, as other aspects of the final rule provide less burdensome means of ensuring that workers other than senior executives will not be bound or chilled from competitive activity by non-competes after the effective date. Under § 910.2(a)(1)(ii), it is an unfair method of competition for a person to enforce or attempt to enforce a non-compete (except where, under § 910.3 the person has a good-faith basis to believe that the final rule is inapplicable). Further, under § 910.2(b)(1), the person who entered into the non-compete must provide clear and conspicuous notice to the worker by the effective date that the worker's non-compete clause is no longer in effect and will not be, and cannot legally be, enforced against the worker. These provisions are sufficient to achieve the purposes of the proposed rescission requirement without requiring any affirmative conduct beyond the notice requirement.

The Commission has also eliminated the proposed rescission requirement in response to comments expressing confusion about the requirement and concern about its practical implications. Some comments interpreted the proposed rescission requirement to mean that the worker and employer must be returned to their original positions (*i.e.,* on the day they entered into the non-compete) and presumed to not have entered into it or that it mandated wholly new contracts to replace any existing agreements that contained non-competes. Some commenters objected to what they considered the high compliance costs of rescinding and revising every employment contract with a non-compete. Some businesses said their contracts with senior executives and potentially other workers would be unwound by a rescission requirement. Other commenters said that if the Commission promulgated the proposed rescission requirement, it would be disregarding the role non-competes played in the overall value of the exchange for an employment contract. An industry association said rescission would require assessment of each contract's severability under relevant State law, and the answers would vary widely.

The Commission does not intend for the final rule to have such effect and has omitted the rescission requirement proposed in the NPRM. The Commission also adopts § 910.3(b), which provides an exception for causes of action that accrued before the effective date, to be clear that the final rule does not render any existing non-competes unenforceable or invalid from the date of their origin. Instead, it is an unfair method of competition to enforce

[839] *See* NPRM, proposed § 910.2(b).

[840] *Id.* at 3513.

[841] *Id.* at 3514.

[842] *Id.* at 3513.

certain non-competes beginning on the effective date. Actions taken before the effective date—for example, enforcing an existing non-compete or making representations related to an existing non-compete—are not unfair methods of competition under the final rule. As noted elsewhere, the Commission also exempts from the rule future enforcement of existing non-competes with senior executives.

Commenters also argued that a rescission requirement would be impermissibly retroactive, present due process concerns, and/or constitute an impermissible taking under the Fifth Amendment. The Commission responds to these comments in Part V.B.

Numerous commenters opposed the proposed rescission requirement based on perceived challenges presented by proposed § 910.1(b)(2), which addressed *de facto* non-competes, and its purported ambiguity with respect to which contractual terms employers would be required to rescind. The Commission has removed the rescission requirement for the reasons described in this Part IV.E.2.a and has also revised the proposed rule's language concerning *de facto* non-competes to clarify the scope of the definition.

b. The Final Rule's Notice Requirement

While the final rule does not require rescission (*i.e.,* legal modification) of existing non-competes, the final rule does prohibit enforcement of existing non-competes after the effective date and requires the person who entered into the non-compete with the worker to provide clear and conspicuous notice to the worker, by the effective date, that the worker's non-compete will not be, and cannot legally be, enforced against the worker.[843] The notice must identify the person who entered into the non-compete with the worker and must be on paper delivered by hand to the worker, or by mail at the worker's last known personal street address, or by email at an email address belonging to the worker, including the worker's current work email address or last known personal email address, or by text message at a mobile telephone number belonging to the worker.[844]

Several commenters emphasized the importance of notice, especially for former workers who may be actively refraining from competitive activity (in compliance with a non-compete), and who may continue to do so if they are not informed that their non-compete is no longer in effect. One commenter highlighted the importance of notice, because a non-compete may be coercive regardless of its enforceability. Many commenters emphasized the need for clear and concise language in the notices, including in languages other than English. One commenter asked the Commission to use concrete, lay-friendly terms to help reduce workers' fears of being sued. A commenter that recommended notice in languages other than English suggested that such a requirement apply to medium and large businesses with a threshold percentage of workers (such as 10%) who primarily speak a language other than English.

Commenters also suggested changes in notice procedures to improve the chances of workers receiving and understanding the notice. One commenter stated that text messages should not qualify as a primary means of individual notice because they are too casual, may be automatically deleted, and the sender may not be identifiable. However, in this commenter's view, text messages could be a secondary form of notice. Some commenters suggested that in addition to individual notice, the final rule should require an employer to post a copy of the notice in the workplace and/or online.

A number of commenters asserted that the requirement for employers to provide notice to former workers when ''the employer has the worker's contact information readily available'' was confusing or burdensome. A commenter stated that employers do not update former employees' contact information, so such information is likely incomplete and might be inaccurate. One commenter asserted that a requirement to provide notice within 45 days of the effective date is too difficult for small businesses. Another commenter suggested that the final rule should require contacting only former workers who left the firm two years or less before the effective date, unless the non-compete has elapsed.[845] Some commenters expressed concern that former workers might not be notified under the ''readily available'' standard. A commenter stated that, to avoid confusion and evasion, employers should be required to send notice to former workers at the worker's last known home address, email address, or cell phone number. Commenters also contended that the meaning of ''individualized communication'' was not clear or that compliance with it would be too difficult or burdensome.

The Commission finalizes the proposed rule's notice requirement largely as proposed, with minor revisions to facilitate compliance, reduce burdens on employers, and improve accessibility for non-English speakers.[846] The final rule also requires covered businesses to provide notice by the effective date, rather than 45 days thereafter, to simplify the final rule and to secure its benefits for competition in labor markets and product and service markets as soon as practicable.

The Commission finalizes a notice requirement because the available evidence indicates that many workers are not aware of the applicable law governing non-competes or their rights under those laws, or are unable to enforce their rights—and are chilled from engaging in competitive activity as a result. The evidence shows that even when employers impose non-competes that are unenforceable under State law, many workers believe they are bound by them (or are otherwise unable to enforce their rights to be free of non-competes).[847] As a result, the Commission finds that even after the final rule is in effect, absent a clear notice requirement, many workers may be unaware that, because of the final rule, their employer cannot enforce a non-compete and that the Commission has the authority to take action against employers who violate the final rule. Accordingly, absent notice, these workers may continue to be chilled from switching jobs or starting their own business. This would tend to negatively affect competitive conditions in the

[843] § 910.2(b)(1).

[844] This language mirrors language in other Federal regulations. *See, e.g.,* 17 CFR 9.11 (notice of disciplinary action must be made personally by mail at the person's last known address or last known email address); 29 CFR 38.79 (written notice must be sent to a ''complainant's last known address, email address (or another known method of contacting the complainant in writing)''); 16 CFR 318.5 (providing for written notification at an individual's last known address, or email if the individual chooses that option).

[845] Under the final rule, notice is only required for existing non-competes, *i.e.,* those that have not elapsed.

[846] The Commission notes that this required notice is a routine disclosure of valuable, factual information to workers that does not implicate the First Amendment. *See Milavetz, Gallop & Milavetz, P.A.* v. *United States,* 559 U.S. 229, 249–53 (2010) (citing *Zauderer* v. *Off. of Disciplinary Counsel,* 471 U.S. 626, 651 (1985)). As described in this Part IV.E, the Commission adopts this notice requirement to ensure workers do not wrongly believe they remain bound by unenforceable non-competes after the rule goes into effect. The Commission's conclusion that such notice is necessary to achieve the full benefits of the final rule is based on its expertise and on empirical evidence supporting the Commission's finding of an *in terrorem* effect related to non-competes.

[847] *See* Prescott & Starr, *supra* note 413; *see also* Part IV.B.2.b.ii (describing the Commission's finding that non-competes are exploitative and coercive where they trap workers in jobs or force them to bear significant harms or costs, even where workers believe the non-compete is unenforceable).

same manner as if non-competes were in full force and effect.

A notice requirement helps address this concern by informing individual workers, to the extent possible, that after the effective date the employer will not enforce any non-compete against the worker. The Commission believes that prompt and clear notice to workers other than senior executives that non-competes are no longer enforceable is essential to furthering the purposes of the final rule—to allow workers to seek or accept another job or to leave to start and run a business, and to allow other employers to compete freely for workers. Indeed, the Commission has refined the model language to make it shorter and clearer than the proposed model language.

While the proposed rule would have required employers to provide the notice no later than 45 days after the compliance date, the final rule requires notice no later than the effective date (*i.e.,* no later than 120 days after the final rule is published in the **Federal Register**). The Commission believes that it is practicable and reasonable for employers to provide the notice by the effective date. The Commission has designed the notice requirement to make compliance as easy as possible for employers. The final rule provides safe harbor model language that satisfies the notice requirement;[848] gives employers several options for providing the notice—on paper, by mail, by email, or by text;[849] and exempts employers from the notice requirement where the employer has no record of a street address, email address, or mobile telephone number for the worker.[850]

In addition, while the model language in the proposed rule used the phrase ''the non-compete clause in your contract is no longer in effect,''[851] the model language in the final rule uses the phrase ''[EMPLOYER NAME] will not enforce any non-compete clause against you.''[852] Because this language does not identify the recipient as having a non-compete, the employer does not need to determine which of its workers have non-competes; instead, it can simply send a mass communication such as a mass email to current and former workers.

Furthermore, requiring notice by the effective date simplifies the final rule and allows its benefits to begin sooner. In response to commenters that contended that they need more time to provide workers notice, the Commission believes that providing notice should not be time-consuming, even for small businesses, particularly given that the final rule provides model language, allows use of the worker's last known contact information for notice, allows digital notice, and (unlike in the proposed rule) categorically exempts an employer who has no such information from the notice requirement. Moreover, as described in Part IV.B.2.b.ii, non-competes trap workers in jobs or force them to bear other significant harms or costs—even where workers believe the non-compete is unenforceable. Given the limited burdens associated with providing notice only to workers whose last known contact information is on file and employers' option to simply copy and paste the safe harbor model notice, as well as the known and currently ongoing acute harms of non-competes (including their *in terrorem* effects) and the importance of workers knowing as soon as possible that their non-compete is unenforceable, the Commission declines to extend the time to provide notice.[853] The Commission finds that 120 days is more than adequate for employers to complete this task.

In response to comments expressing concern that the NPRM's ''individualized communication'' requirement was unclear or burdensome, the Commission has removed that language. Instead, the final rule ensures each worker will receive notice while specifying several permissible methods for providing the notice, which furthers compliance certainty while giving employers a range of options and an efficient means of complying. By allowing a number of formats for such communications, including digital formats, employers are more likely to be able to contact workers rapidly, individually, and have flexibility to do so at low cost. Accordingly, § 910.2(b)(2) of the final rule allows for notice by text message, by email, as well as paper notice by hand or by mail to the worker's last known street address. The final rule gives employers flexibility to choose among these methods. In responses to the concerns expressed by the commenter about text messages, the Commission believes that text messages should be a permissible method for providing the notice because they are widely used, delivered quickly, low-cost for employers, and an effective means of communication for workers who do not have email accounts.

In response to comments contending that notice to former workers is too burdensome or difficult, the Commission believes that providing notice to former workers is critical because former workers may be refraining from competitive activity because they believe they are subject to a non-compete. The Commission disagrees that providing notice to former workers will be burdensome. The Commission believes that most employers have contact information for former workers who may be subject to non-competes.[854] And under the final rule, in those rare cases in which an employer has no record of a street address, email address, mobile telephone number, or other method of contacting the worker or former worker, § 910.2(b)(3) exempts the employer from the final rule's notice requirement with respect to the worker. Furthermore, by specifying the circumstances under which notice may not be provided, this exemption also addresses concerns expressed by some commenters that ambiguity in the proposed rule's ''readily available'' standard for notifying former workers would lead to fewer former workers being notified.

In response to comments contending that notice to former workers is too burdensome or difficult, the Commission believes that providing notice to former workers is critical because former workers may be refraining from competitive activity because they believe they are subject to a non-compete. In light of the comments about the proposed ''readily available'' contact information standard, the Commission in this final rule does not adopt that language and instead requires that the notice must be on paper delivered by hand to the worker, or by mail at the worker's last known personal street address, or by email at an email address belonging to the worker, including the worker's current work email address or last known personal email address, or by text message at a mobile telephone number belonging to the worker. The Commission agrees with commenters that stated that most employers have such contact information for both present and former workers. For those rare cases in which

[848] § 910.2(b)(4)–(5).

[849] § 910.2(b)(2)(ii).

[850] § 910.2(b)(3).

[851] NPRM, proposed § 910.2(b)(2)(iii).

[852] § 910.2(b)(4).

[853] The Commission addresses the effective date in Part VIII.

[854] Employers have many record-keeping requirements under State and Federal laws under which they may retain the contact information described in § 910.2(b)(2)(ii). *See, e.g.,* IRS, Circular E, Employer's Tax Guide, Pub. 15, 8 (2024) (''Keep all records of employment taxes for at least 4 years,'' including addresses of employees and recipients and forms with addresses.); USCIS, Handbook for Employers M–274, Sec. 10.0, Retaining Form I–9 (requiring retention of I–9 form, which includes employees' addresses, email addresses, and telephone numbers).

an employer has no record of a street address, email address, mobile telephone number, or other method of contacting the worker or former worker, § 910.2(b)(3) exempts the employer from the final rule's notice requirement.

The Commission agrees with comments that notices in other languages spoken by workers would help achieve the goal of informing workers that their non-competes are no longer enforceable and help employers to comply with the final rule. However, to avoid imposing a burden of translation on employers, § 910.2(b)(6) makes it optional to provide notices in languages other than English. The Commission encourages employers to provide this notice to workers who speak languages other than English. To facilitate the provision of notices in other languages, the final rule provides a model notice in English and links to translations of other languages that are commonly spoken in U.S. homes, including Spanish, Chinese, Arabic, Vietnamese, Tagalog, and Korean.[855]

V. Section 910.3: Exceptions

A. Section 910.3(a): Exception for Persons Selling a Business Entity

In the NPRM, the Commission proposed an exception for certain non-competes between the seller and the buyer of a business that applied only to a substantial owner, member, or partner, defined as an owner, member, or partner with at least 25% ownership interest in the business entity being sold. Based on comments, the Commission adopts an exception for the bona fide sale of a business without requiring that the seller have at least a 25% ownership interest.

1. The Proposed Rule

Proposed § 910.3 allowed non-competes where the restricted party is ''a person who is selling a business entity or otherwise disposing of all of the person's ownership interest in the business entity, or . . . selling all or substantially all of a business entity's operating assets,'' and is also ''a substantial owner of, or substantial member or substantial partner in, the business entity at the time the person enters into the non-compete.'' [856] The Commission proposed to define ''substantial owner, substantial member, and substantial partner'' as ''an owner, member, or partner holding at least a 25 percent ownership interest in a business entity.'' [857] The text of proposed § 910.3 stated that non-competes allowed under the proposed exception would remain subject to Federal antitrust law and all other applicable law.

The Commission stated in the NPRM that its proposal to exempt from the rule non-competes between the seller and the buyer of a business did not reflect a finding that such non-competes are beneficial to competition.[858] Rather, the Commission explained that such non-competes may implicate unique interests and have unique effects, and the evidentiary record did not permit the Commission to thoroughly assess the full implications of restricting their enforceability.[859] The Commission noted that because all States permit non-competes between the seller and the buyer of a business to some degree, and because the laws that apply to these types of non-competes have seen fewer changes recently than the laws applicable to non-competes that arise solely out of employment, there have not been natural experiments allowing researchers to assess this type of non-compete's effect on competition.[860]

2. Comments Received

A few commenters suggested eliminating the proposed exception. These commenters contended that non-competes between the seller and the buyer of a business may still be exploitative and coercive, particularly in the case of small business owners in transactions with larger, better-resourced corporations. However, most commenters who addressed the issue supported an exception that would allow certain non-competes between the seller and the buyer of a business. These commenters agreed with the NPRM that State common law generally applies less-intensive scrutiny to non-competes ancillary to the sale of a business and that every State statute banning non-competes has an exception which allows some or all non-competes between the seller and the buyer of a business. Most of the commenters who supported some form of exception for non-competes between the seller and the buyer of a business contended that they are necessary to protect the value of the sale by ensuring the effective transfer of the business's goodwill. According to these commenters, a buyer will be less willing to pay for a business if they cannot obtain assurance that they will be protected from future competition by the seller, and so a failure to exempt related non-competes may chill acquisitions. Commenters stated that sellers of a business have more bargaining power than workers do and generally receive a portion of the sales price, making exploitation and coercion less likely. They also noted that non-competes between the seller and the buyer of a business remain subject to State limitations on scope, duration, and reasonableness.

Some commenters supported the proposed 25% ownership threshold. However, most commenters who otherwise supported the exception stated that the proposed 25% ownership threshold is too high. They argued that the 25% threshold does not account for the reality of most transactions, in which owners with less than 25% interest in a business may have significant goodwill and receive significant proceeds from a sale. Some commenters focused on the tax costs of the threshold, pointing to IRS provisions that currently allow taxpayers to deduct from their taxable income the portion of the sales price made in exchange for non-competes. Others argued that the 25% threshold would disincentivize equity-based consideration. To avoid these harms, these commenters suggested a variety of other thresholds, including the 5% ownership threshold used in SEC regulations.[861] Some commenters contended that the Commission failed to provide evidence justifying the proposed 25% ownership threshold. Others questioned the effectiveness of ownership as a proxy for goodwill or the likelihood of exploitation and coercion. As examples, these commenters pointed to passive investors who may have significant ownership stakes in a business but none of its goodwill, and owners whose interests may be purchased for less than fair market value or who are excluded from sales negotiations.

A few commenters argued that the proposed 25% threshold would preempt the laws of California and other States which ban non-competes except in the sale of a business, none of which require that the seller have a substantial ownership stake. They pointed to cases in which California courts applied the exception and allowed enforcement of non-competes against shareholders holding as little as a 3% ownership interest. In light of these statutes, some of these commenters urged the Commission to adopt an exception for

agreements that involve the sale of a business or equity in a company without a threshold ownership requirement.

Some commenters urged the Commission to adopt a case-by-case assessment of business sales based on State law, such as a ''totality of the circumstances'' or ''reasonableness'' test. Others proposed replacing the ownership-based exception with an exception for founders, key workers with IP access, and/or those with goodwill. At least one commenter asked the Commission to use a bright-line rule rather than a functional or definitional test that would require adjudication and interpretation by courts.

Some commenters presented empirical evidence to justify a lower ownership threshold. A few commenters pointed to data suggesting that more than 96% of CEOs of the 3,000 largest publicly traded companies own less than 25% of their company. One commenter pointed to data suggesting that the average duration of a startup's life from fundraising to acquisition is 6.1 years, arguing that it is unlikely for venture-capital backed businesses to operate and grow for that period of time without accepting funding that dilutes founders' and key employees' equity stake in the business. Other commenters supporting a lower threshold provided anecdotal evidence that businesses cede large shares to financial backers, resulting in many owner-operators holding significantly less than a 25% share in their business.

Finally, some commenters focused on eliminating potential loopholes to the proposed exception. Some commenters expressed concern that employers may set up sham transactions with wholly owned subsidiaries in order to impose non-competes that would otherwise be prohibited under the rule, urging the Commission to clarify that the exception applies only to bona fide transfers to an independent third party. Some commenters contended that firms may use ''springing'' non-competes (in which a worker must agree at the time of hiring to a non-compete in the event of some future sale) and repurchase rights, mandatory stock redemption programs, or similar stock-transfer schemes (pursuant to which a worker may be required to sell their shares if a certain event occurs) to impose non-competes on their workers which would otherwise be prohibited. They urged the Commission to address those instances specifically, including by defining the exception by the percentage of total equity value received in liquid proceeds at the time of the relevant transaction.

3. The Final Rule

The Commission adopts a sale of business exception for substantially the same reasons articulated in the NPRM. However, in response to comments concerning the ownership percentage threshold, the Commission modifies § 910.3(a) so that it no longer includes the proposed requirement that the restricted party be ''a substantial owner of, or substantial member or substantial partner in, the business entity'' to fall under the exception. The Commission otherwise adopts this provision largely as proposed. To address commenters' concerns that employers will use sham transactions, stock-transfer schemes or other mechanisms designed to evade the rule, § 910.3(a) requires that, to fall under the exemption, a non-compete must be entered into pursuant to a bona fide sale.

The Commission reiterates that § 910.3(a) does not reflect a finding that non-competes between the seller and the buyer of a business are beneficial to competition or that they are not restrictive and exclusionary or exploitative and coercive. Indeed, the Commission acknowledges that some non-competes between the seller and buyer of a business may be exploitative and coercive due to an imbalance in bargaining power and/or may tend to harm competitive conditions. However, commenters did not present empirical research on the prevalence of non-competes between the seller and the buyer of a business or on the aggregate economic effects of applying additional legal restrictions to non-competes between the seller and buyer of a business. The Commission's decision to adopt § 910.3(a) reflects the view of the Commission and most commenters that, compared to non-competes arising solely out of an employment relationship, non-competes between the sellers and buyers of businesses may implicate unique interests and have unique effects that this rulemaking record does not address.[862]

The proposed requirement that an excepted non-compete bind only a ''substantial'' owner, member or partner of the business entity being sold was designed to allow those non-competes between the seller and the buyer of a business which are critical to effectively transfer goodwill while prohibiting those which are more likely to be exploitative and coercive due to an imbalance of bargaining power between the seller and the buyer. However, commenters persuasively argued that the proposed 25% ownership threshold was too high because it failed to reflect the relatively low ownership interest held by many owners, members, and partners with significant goodwill in their business. The Commission declines to maintain the ''substantial'' interest requirement with a lower percentage threshold for the same reason.

The Commission also declines to adopt a threshold of $1 million, $250,000, or some other dollar limit on the proceeds received by the seller. On the current record, these thresholds were not sufficiently correlated to sellers' goodwill or bargaining power for a broadly generalizable approach. The Commission declines to adopt a ''totality of the circumstances'' or ''reasonableness'' test in the text of § 910.3(a) because they would provide little meaningful guidance to buyers and sellers and would be difficult to administer. For the same reasons, the Commission declines to replace the ownership-based exception with an exception for founders, key workers, workers with access to intellectual property, and/or workers with goodwill. Furthermore, non-competes allowed under the exception will continue to be governed by State law, which generally requires a showing that a non-compete is necessary to protect the value of the business being sold, as well as Federal antitrust law.[863]

Finally, the Commission agrees with commenters' concerns about the risks that firms may abuse the exception through sham transactions with wholly owned subsidiaries, ''springing'' non-competes, repurchase rights, mandatory stock redemption programs, or similar evasion schemes. The Commission adds the term ''bona fide'' and makes changes clarifying that any excepted non-compete must be made ''pursuant to a bona fide sale'' to ensure that such schemes are prohibited under the rule. A bona fide sale is one made in good faith as opposed to, for example, a transaction whose sole purpose is to evade the final rule.[864] In general, the Commission considers a bona fide sale to be one that is made between two

[862] *See* NPRM at 3514–15.

[863] *See, e.g., U.S.* v. *Addyston Pipe & Steel Co.,* 85 F. 271, 281 (6th Cir. 1898) (''For the reasons given, then, covenants in partial restraint of trade are generally upheld as valid when they are agreements [*inter alia*] by the seller of property or business not to compete with the buyer in such a way as to derogate from the value of the property or business sold . . . . Before such agreements are upheld, however, the court must find that the restraints attempted thereby are reasonably necessary . . . to the enjoyment by the buyer of the property, good will, or interest in the partnership bought. . . .'').

[864] Black's Law Dictionary defines bona fide as ''[m]ade in good faith; without fraud or deceit,'' and ''[s]incere; genuine.'' (11th ed. 2019).

independent parties at arm's length, and in which the seller has a reasonable opportunity to negotiate the terms of the sale. So-called ''springing'' non-competes and non-competes arising out of repurchase rights or mandatory stock redemption programs are not entered into pursuant to a bona fide sale because, in each case, the worker has no good will that they are exchanging for the non-compete or knowledge of or ability to negotiate the terms or conditions of the sale at the time of contracting. Similarly, sham transactions between wholly owned subsidiaries are not bona fide sales because they are not made between two independent parties.

The Commission declines to specifically delineate each kind of sales transaction which is not a bona fide sale under the exception to avoid the appearance that any arrangement not listed is allowed under the exception. Courts have effectively identified and prohibited such schemes pursuant to State statutes prohibiting non-competes.[865] In addition, non-competes allowed under the sale-of-business exception remain subject to Federal and State antitrust laws, including section 5 of the FTC Act.

B. Section 910.3(b): Exception for Existing Causes of Action

Proposed § 910.2(a) would have prohibited employers from maintaining an existing non-compete with a worker. The proposed rule also would have required employers to rescind existing non-competes.[866] Commenters argued that any invalidation or rescission required of existing non-competes would be impermissibly retroactive, present due process concerns, and/or constitute an impermissible taking under the Fifth Amendment.

As described in Part IV.C.5, the Commission adopts a modified § 910.2(a) under which existing non-competes for workers who are not senior executives are no longer enforceable. The Commission adds an exception in § 910.3(b) in response to comments raising concerns related to retroactivity. Section 910.3(b) specifies that the final rule does not apply if a cause of action related to a non-compete provision accrued prior to the effective date. This includes, for example, where an employer alleges that a worker accepted employment in breach of a non-compete if the alleged breach occurred prior to the effective date. This provision responds to concerns that the final rule would apply retroactively by extinguishing or impairing vested rights acquired under existing law prior to the effective date.[867] In this Part V.B, the Commission addresses commenters' arguments regarding retroactivity, due process, and impermissible taking under the Fifth Amendment.

1. Retroactivity

A number of commenters asserted that applying the final rule to prohibit the enforcement of existing non-competes would render the final rule impermissibly retroactive. The Commission disagrees. A rule ''does not operate 'retrospectively' merely because it is applied in a case arising from conduct antedating the [rule's] enactment, or upsets expectations based in prior law.'' [868] Rather, courts have explained that an ''administrative . . . rule is retroactive [only] if it takes away or impairs vested rights acquired under existing law, or creates a new obligation, imposes a new duty, or attaches a new disability in respect to transactions or considerations already passed.'' [869] ''A rule that 'alter[s]' the past legal consequences of 'past action' is retroactive,'' while a rule that '''alter[s] only the 'future effect' of past actions, in contrast, is not.'' [870] Agency action ''that only upsets expectations based on prior law is not retroactive.'' [871]

The final rule is not impermissibly retroactive because it does not impose any legal consequences on conduct predating the effective date. The Commission is not creating any new obligations, imposing any new duties, or attaching any new disabilities for past conduct.[872] And to minimize concerns about retroactivity, the Commission adopts § 910.3(b), which states that the final rule does not apply where a cause of action related to a non-compete accrues before the effective date. The notice requirement in § 910.2(b) likewise does not render the final rule impermissibly retroactive because that requirement merely requires notice that non-competes that exist after the effective date will not be enforced in the future with respect to workers other than senior executives. No penalties attach to persons who entered non-competes before the effective date.

This final rule is analogous to the FCC rulemaking upheld in *National Cable & Telecommunications Ass'n* v. *FCC.* There, the agency promulgated a rule that ''forbade cable operators not only from entering into new exclusivity contracts, but also from enforcing old ones.'' [873] The court upheld the rule against a retroactivity challenge because the FCC had ''impaired the future value of past bargains but ha[d] not rendered past actions illegal or otherwise sanctionable.'' [874] This final rule does the same with existing non-competes. The final rule does not render it illegal or otherwise sanctionable for parties to have entered into non-competes before the effective date; it merely provides that persons cannot enforce or attempt to enforce such agreements with workers other than senior executives or represent to such workers that they are bound by an enforceable non-compete after the effective date. It is thus not impermissibly retroactive.

In *National Cable,* the court also considered whether the agency had ''balance[d] the harmful 'secondary retroactivity' of upsetting prior expectations or existing investments against the benefits of applying [its] rules to those preexisting interests.'' [875] While commenters did not frame their objection as one of ''secondary retroactivity,'' some did object that the final rule would upset the benefits of pre-existing bargains. As in *National Cable,* however, the Commission has ''expressly consider[ed] the relative benefits and burdens of applying its rule

---

[865] *See, e.g., Bosley Med. Grp.* v. *Abramson,* 161 Cal. App. 3d 284, 291 (Cal. Ct. App. 1984) (refusing to enforce non-compete imposed on physician under agreement requiring physician to purchase 9% of stock at hiring and resell to corporation upon termination because agreement ''was devised to permit plaintiffs to accomplish that which the law otherwise prohibited: an agreement to prevent defendant from leaving plaintiff medical group and opening a competitive practice'').

[866] *See* proposed § 910.2(b)(1).

[867] As discussed in Part V.B.1, courts have explained that an ''administrative . . . rule is retroactive [only] if it takes away or impairs vested rights acquired under existing law, or creates a new obligation, imposes a new duty, or attaches a new disability in respect to transactions or considerations already passed.'' *Regents of the Univ. of Cal.* v. *Burwell,* 155 F. Supp. 3d 31, 44 (D.D.C. 2016) (alteration in original) (quoting *Nat'l Min. Ass'n* v. *DOL,* 292 F.3d 849, 859 (D.C. Cir. 2002)). But a regulation is *not* retroactive simply because it ''impair[s] the future value of past bargains'' if it does not also ''render[ ] past actions illegal or otherwise sanctionable.'' *Nat'l Cable & Telecomms. Ass'n* v. *FCC,* 567 F.3d 659, 670 (D.C. Cir. 2009).

[868] *Landgraf* v. *USI Film Prods.,* 511 U.S. 244, 269 (1994).

[869] *Burwell,* 155 F. Supp. 3d at 44 (alteration in original) (quoting *Nat'l Min. Ass'n,* 292 F.3d at 859).

[870] *Id.* (alterations in original) (quoting *Ne. Hosp. Corp.* v. *Sebelius,* 657 F.3d 1, 14 (D.C. Cir. 2011)).

[871] *Nat'l Cable,* 567 F.3d at 670 (internal quotation omitted) (quoting *Mobile Relay Assocs.* v. *FCC,* 457 F.3d 1, 11 (D.C. Cir. 2006)).

[872] For instance, the D.C. Circuit found that agency action impermissibly attached a ''new disability'' when a Department of Interior rule made mine operators ineligible for a surface mining permit based on ''pre-rule violations.'' *Nat'l Min. Ass'n* v. *U.S. DOI,* 177 F.3d 1, 8 (D.C. Cir. 1999). Here, the final rule imposes no penalties or other disabilities on persons who entered into non-competes before the effective date.

[873] *Nat'l Cable,* 567 F.3d at 661.

[874] *Id.* at 670.

[875] *Id.* at 670.

to existing contracts.'' [876] This consideration led the Commission to adopt the various exceptions described in the final rule, including the decision not to apply the final rule to non-competes entered into with senior executives before the effective date. As explained in Part IV.B, however, the Commission has determined that, for workers other than senior executives, there are substantial benefits to applying the rule to prohibit the future enforcement of non-competes entered into before the effective date. These benefits include the anticipated increase in worker earnings, new business formation, and innovation.[877] Additionally, the Commission finds such agreements are generally coercive and exploitative, so prohibiting their future enforcement is also a benefit.[878]

In the Commission's view, these significant benefits justify any burdens of applying the final rule to the future enforcement of pre-existing agreements with workers other than senior executives. Having balanced the burdens and benefits of so applying the final rule, the Commission has satisfied its obligation to consider the secondary retroactivity effects of the final rule. Moreover, the Commission notes that non-competes were already subject to case-by-case adjudication under section 5.[879] Employers were thus already responsible, even before the final rule, for ensuring their non-competes are not unfair methods of competition.

2. Takings

The Commission also disagrees with commenters who contended that applying the final rule to non-competes entered into before the effective date would violate the Fifth Amendment by effecting a taking without due compensation. Some comments interpreted the proposed rescission requirement to mean that the worker and employer must be returned to their original positions (*i.e.,* on the day they entered into the non-compete) and presumed to not have entered the agreement, or that the rule would mandate wholly new contracts to replace any existing agreements that contained non-competes. The Commission does not intend the final rule to have such effect and has omitted the rescission requirement proposed in the NPRM. The Commission also adopts § 910.3(b), which provides an exception for causes of action that accrued before the effective date, to clarify that the final rule is purely prospective. The final rule does not render any existing non-competes unenforceable or invalid from the date of their origin. Instead, under the final rule, it is an unfair method of competition to enforce certain non-competes beginning on the effective date. Action taken before the effective date to enforce an existing non-compete or representations made before the effective date related to an existing non-compete are not an unfair method of competition under the final rule. The final rule does not effectuate a taking.

The Takings Clause provides that ''private property'' shall not ''be taken for public use, without just compensation.'' [880] When, as here, ''the government, rather than appropriating private property for itself or a third party, imposes regulations that restrict an owner's ability to use his own property,'' courts consider whether the regulation ''goes too far'' and constitutes a ''regulatory taking.'' [881] Consistent with the Supreme Court's decision in *Penn Central Transportation Co.* v. *City of New York* (''*Penn Central*''), this is necessarily an ''ad hoc, factual inquir[y]'' and focuses on three factors: ''the economic impact of the regulation on the claimant''; ''the extent to which the regulation has interfered with distinct investment-backed expectations''; and ''the character of the governmental action.'' [882] ''[T]he *Penn Central* inquiry turns in large part, albeit not exclusively, upon the magnitude of a regulation's economic impact and the degree to which it interferes with legitimate property interests.'' [883] As a general matter, ''the fact that legislation disregards or destroys existing contractual rights does not always transform the regulation into an illegal taking.'' [884]

Under the *Penn Central* test, the final rule does not effect a taking as a matter of law. First, the economic impact of the regulation on employers with existing non-competes with workers who are not senior executives is insufficient to constitute a taking.[885] The Commission has found that such agreements are rarely the product of bargaining, and that little to nothing is offered in exchange for them. And research has confirmed that for many such agreements, employers do not value the ability to enforce the agreements.[886] The final rule also includes provisions that allow employers and workers to ''moderate and mitigate the economic impact'' of the final rule.[887] The Commission has made clear that employers may continue to use reasonable NDAs and trade secrets law to protect their interests, including customer goodwill.[888] In fact, one study finds that 97.5% of workers with non-competes are also subject to a non-solicitation agreement, NDA, or a non-recruitment agreement, and 74.7% of workers with non-competes are subject to all three provisions.[889] And in cases where non-competes with workers other than senior executives were tied to benefits like cash or equity, the Commission has provided time for those agreements to be renegotiated if necessary.[890] For senior executives, the Commission allows existing agreements to continue to be enforced.

The character of the governmental action here also counsels against viewing the final rule as a taking. ''A 'taking' may more readily be found when the interference with property can be characterized as a physical invasion by government . . . than when interference arises from some public program adjusting the benefits and burdens of economic life to promote the common good.'' [891] There is no physical invasion here, and the final rule is promulgated under the Commission's authority to identify and prohibit unfair methods of competition.[892] Among other economic benefits described in Part IV.B, the Commission finds economy-wide benefits, including increases in new business formation and innovation. The Commission also finds that the final rule will increase earnings for workers by preventing enforcement of agreements that suppress their earnings. Moreover, non-competes have long been subject to government regulation, including not only section 5 of the FTC Act, but also State common

law, State enactments, and other Federal antitrust laws.

Finally, the final rule does not upset investment-backed expectations to the extent necessary to constitute a taking. Even in States that prohibit some or all non-competes, employers make many investments in workers that they would continue to make regardless of their ability to use non-competes, such as training, or that would be protected by other mechanisms, such as reasonable NDAs, trade secret law, and/or fixed term contracts. In other words, non-competes are not a prerequisite to employers' productivity and output, in large part because (as described in Part IV.D) employers have reasonable alternatives to protecting the investments they make. The Commission has also lessened the economic burden of the final rule by creating an exception for situations where a cause of action accrued before the effective date.[893] Furthermore, States and the Federal government have regulated and considered further regulating non-competes for years, and the Commission issued the NPRM more than 18 months before the effective date—and began exploring whether to regulate non-compete agreements more than five years ago.[894] There has thus been ample notice that non-competes may become unenforceable by rule,[895] and prior to this rule non-competes were already subject to case-by-case adjudication under section 5. For all these reasons, the Commission does not believe the final rule constitutes a taking.

3. Due Process

Similarly, the Commission disagrees with commenters who argued that applying the final rule to existing non-competes would present due process concerns. Assuming that these due process concerns are independent of other constitutional concerns like the alleged retroactive application of the final rule,[896] which are addressed in Parts V.B.1 and V.B.2, the Commission disagrees that there is any due process infirmity. Due process requires the government, at a minimum, to provide notice and an opportunity to be heard before depriving any person of property.[897] By issuing the NPRM and engaging in notice-and-comment rulemaking, the Commission has provided sufficient due process. And on top of the notice-and-comment process, there will be further process in an administrative adjudication or in court before any person is found to have violated the rule.

C. Section 910.3(c): Good Faith Exception

The Commission adds an exception in § 910.3(c) in an abundance of caution to ensure the final rule does not infringe on activity that is protected by the First Amendment[898] and to improve clarity in § 910.2(a). The exception states: ''It is not an unfair method of competition to enforce or attempt to enforce a non-compete clause or to make representations about a non-compete clause where a person has a good-faith basis to believe that this part 910 is inapplicable.'' A similar ''good-faith basis'' clause was in proposed § 910.2(a).

As described in Parts IV.B.4 and IV.C.5, the final rule includes a prohibition on enforcing or attempting to enforce non-competes in both § 910.2(a)(1) and (2). Under the *Noerr-Pennington* doctrine, filing a lawsuit—even if the suit may tend to restrict competition and is ultimately unsuccessful—is typically protected under the First Amendment right to petition and immune from antitrust scrutiny.[899] However, courts have recognized that where a lawsuit is a ''sham,'' *i.e.,* objectively baseless and subjectively designed solely to prevent competition, it is not protected.[900] For a non-compete covered by the final rule, enforcing or attempting to enforce the non-compete would likely be considered a ''sham'' lawsuit. Accordingly, such a lawsuit would not enjoy protection under the First Amendment. Section 910.3(b) ensures, however, that if a circumstance arises under which an employer's enforcement of or attempt to enforce a non-compete is protected by the First Amendment, the final rule does not run afoul of it.

As explained in Parts IV.B.4 and IV.C.5, the Commission adopts a prohibition on ''representing'' that a worker is subject to a non-compete in §§ 910.2(a)(1)(iii) and 910.2(a)(2)(iii). In § 910.3(c), the Commission incorporates a ''good-faith'' exception that applies to the prohibition on ''representing'' the worker is subject to a non-compete. Taken together, these provisions of the final rule prohibit an employer from representing to a worker that the worker is subject to a non-compete unless the employer has a good-faith basis to believe the worker is subject to an enforceable non-compete.

The Supreme Court has held ''there can be no constitutional objection to the suppression of commercial messages that do not accurately inform the public about lawful activity.'' [901] Accordingly, ''[t]he government may ban forms of communication more likely to deceive the public than to inform it, . . . or commercial speech related to illegal activity.'' [902] The final rule does not cover protected speech because it prohibits only misrepresentations about whether a non-compete covered by the rule is enforceable. The good-faith exception in § 910.3(b) ensures, however, that the final rule does not run afoul of the First Amendment if a circumstance arises under which an employer's representation that a worker is subject to a non-compete is protected by that Amendment.

In the NPRM, the Commission stated that an employer would have no good faith basis to believe that a worker is subject to an enforceable non-compete ''where the validity of the rule . . . has been adjudicated and upheld.'' Some commenters stated that legal challenges to the final rule will create uncertainty and unpredictability related to compliance. The Commission believes the foregoing statement in the NPRM would contribute to this confusion and does not adopt it in this final rule. The Commission clarifies that the absence of a judicial ruling on the validity of the final rule does not create a good-faith basis for non-compliance. If the rule is in effect, employers must comply.

D. Requests To Expand Final Rule Coverage or To Provide an Exception From Coverage Under the Final Rule

In the NPRM, the Commission preliminarily concluded that applying the rule uniformly to all employers and workers would advance the proposed

[893] *See* § 910.3(b).

[894] *See* Part I.B.

[895] *Connolly* v. *Pension Ben. Guar. Corp.,* 475 U.S. 211, 226 (1986).

[896] Commenters invoking a due process concern outside the retroactivity context provided little contextual detail on the precise substance of the concern, nor did they explain what further process would be due before the Commission could promulgate the rule.

[897] *See, e.g., N. Am. Butterfly Ass'n* v. *Wolf,* 977 F.3d 1244, 1265 (D.C. Cir. 2020) (citing *Mathews* v. *Eldridge,* 424 U.S. 319, 333–34 (1976)).

[898] The Commission adopts § 910.3(b)(3) out of an abundance of caution and does not believe that any of the requirements in the final rule run afoul of the First Amendment because the Commission finds that the use of certain existing non-competes is an unlawful unfair method of competition.

[899] *See E.R.R. Presidents' Conference* v. *Noerr Motor Freight, Inc.,* 365 U.S. 127 (1961); *United Mine Workers of Am.* v. *Pennington,* 381 U.S. 657 (1965).

[902] *Id.* at 563–64.

rule's objectives to a greater degree than differentiating among workers on the basis of industry or occupation, earnings, another factor, or some combination of factors, and that it would better ensure workers are aware of their rights under the rule.[903] The Commission sought comment on this topic, including what specific parameters or thresholds, if any, should apply in a rule differentiating among workers.[904]

The vast majority of commenters supported the Commission's proposal to ban non-competes categorically for all workers.[905] Commenters from a broad spectrum of job types and industries stated that non-competes harm competition in a way that hurts workers and employers.

Commenters also supported the rule with perspectives specific to particular industries. In response to the Commission's request for comment on the issue, some commenters argued that the Commission should further expand the rule to cover non-competes between franchisors and franchisees.

Other commenters argued the Commission should differentiate among workers and employers along different parameters. They stated that workers with higher earnings, higher skills, specific job titles, or access to specific types of information should be excluded. Some stated that particular industries should be excluded wholesale, including all workers in an industry regardless of their job duties, while some stated that only certain workers in particular industries should be excluded.

In adopting the final rule, the Commission considered each request for exclusion from or expansion of coverage under the final rule and concludes that the use of covered non-competes is an unfair method of competition. The Commission also concludes that applying the final rule as adopted in part 910 to the full extent of the Commission's jurisdiction with respect to covered workers advances the final rule's objectives to a greater degree than differentiating among workers. In response to, *inter alia,* comments regarding the potential costs and difficulties that may result from invalidating existing non-competes for certain senior executives, however, the final rule differentiates between senior executives and other workers by allowing existing non-competes for senior executives to remain in force. The final rule adopts a uniform rule categorically banning new non-competes for all workers. The Commission substantiates its finding that the use of non-competes with workers is an unfair method of competition in Parts IV.B and IV.C.

In this Part V.D, the Commission addresses comments related to differentiation or exclusion of certain workers, employers, or industries. Comments related to expanding or limiting the definition of worker or employer are addressed in Parts III.C and III.G. Comments related to the Commission's jurisdiction and exclusions from the Commission's jurisdiction in the FTC Act are addressed in Part II.E. Comments related to the prevalence of non-competes within and across industries are addressed in Part I.B.2.

Overall, the Commission is committed to stopping unlawful conduct related to the use of certain non-competes to the full extent of its authority and jurisdiction. The Commission finds every use of a non-compete covered by the final rule to be an unfair method of competition under section 5 of the FTC Act for the reasons in Parts IV.B and IV.C. The use of an unfair method of competition cannot be justified on the basis that it provides a firm with pecuniary benefits.[906] To the extent commenters argue for an exception based on this justification, the Commission declines to create any exception on that basis. Moreover, a uniform rule carries significant benefits, which many commenters who otherwise opposed the NPRM acknowledged.[907] Among those benefits is the certainty for both workers and employers from a uniform rule, which also lessens the likelihood of litigation over uncertain applications. Exceptions for certain industries or types of workers would likely increase uncertainty and litigation costs, as parties would dispute whether a specific business falls within an industry-wide exception. Most importantly, exceptions would fail to remedy the tendency of non-competes to negatively affect competitive conditions in the excepted industries or for excepted types of workers and would likely have *in terrorem* effects.

1. Differentiation by Worker Compensation or Skills

Many commenters sought an exception for highly paid or highly skilled workers, often alongside requests for an exception for senior executives, while many others asked the Commission to keep these workers within the scope of the final rule. Commenters seeking an exception argued that highly paid and highly skilled workers in particular did not experience exploitation and coercion and were more likely to have access to confidential information or client or customer relationships, along with the other justifications for non-competes discussed in Part IV.D. Commenters' specific arguments on the evidence concerning highly paid or highly skilled workers are considered in the relevant subsections of Part IV.B. Many commenters proposed using a compensation threshold to differentiate highly paid workers and senior executives, discussed in IV.C.4.b. Other commenters suggested an exception based on the FLSA exemptions or the worker's level of access to confidential information, discussed in Parts IV.C.4. and V.D.2.

The Commission finds that non-competes have a tendency to negatively affect competitive conditions in labor markets and product and service markets, including non-competes binding highly paid and highly skilled workers. The evidence shows that, among the other effects described in Part IV.B, non-competes for highly paid and highly skilled workers suppress wages for these workers,[908] restrict competitors' access to highly skilled workers,[909] and restrict entrepreneurship.[910] Notably, as described in Parts IV.B.2 and IV.C.1, the Commission concludes that non-competes for highly paid or highly skilled workers who are not senior executives are generally exploitative and coercive. The Commission finds that highly paid and highly skilled workers who are not senior executives only rarely negotiate meaningful consideration in exchange for a non-compete. As the Commission finds, the overwhelming response from commenters, particularly workers, was that non-competes are exploitative and

[903] NPRM at 3518. The NPRM's proposed definition of ''worker'' excluded franchisees in the context of franchisee-franchisor relationships. *Id.* at 3520. The NPRM also proposed an exception for certain non-competes between the seller and the buyer of a business.

[904] NPRM at 3519.

[905] The Commission received over 26,000 public comments from a wide range of stakeholders. Among these comments, over 25,000 expressed support for the Commission's proposal to categorically ban non-competes.

[906] *See, e.g., Atl. Refin. Co.* v. *FTC,* 381 U.S. 357, 371 (1965) (''Upon considering the destructive effect on commerce that would result from the widespread use of these contracts by major oil companies and suppliers, we conclude that the Commission was clearly justified in refusing the participants an opportunity to offset these evils by a showing of economic benefit to themselves.''); *see also* Part II.F.

[907] *See* Part IX.C.

[908] *See* Part IV.B.3.a.ii.

[909] *See* Part IV.C.2.c.i.

[910] *See* Part IV.B.3.b.i.

coercive for many workers in highly paid professions other than senior executives.[911] While there may be highly paid or highly skilled workers who do not meet the definition of ''senior executive'' and who are not exploited or coerced, including workers above the definition's total compensation threshold, the Commission explains in Part IV.C.4 why a compensation threshold is necessary—but not sufficient—for purposes of defining senior executives whose existing non-competes may remain in force under the final rule. Further, the Commission finds that employers have sufficient alternatives to non-competes for highly paid and highly skilled workers.[912] The Commission also explains why it is not exempting all non-competes that were exchanged for consideration in Part IV.C.3. Accordingly, the final rule does not include any workers other than highly paid senior executives in the exception from the ban on enforcing existing non-competes. To ensure that only workers for whom there is insufficient evidence of exploitation and coercion are included in the exception, the final rule narrowly defines senior executive in § 910.1.[913]

2. Differentiation by Worker Access to Information

Some commenters suggested excluding workers with access to trade secrets, confidential business information, or other intellectual capital. Commenters contended these workers are uniquely situated because of their access to valuable employer information. Many commenters responded to these arguments and disagreed with them. Some commenters stated that employers overstate the proportion of workers who have access to such information. Commenters also stated that employers exaggerate the amount or quality of information that should be appropriately considered a trade secret, confidential business information, or other intellectual capital, and therefore exaggerate the purported cost to the firm of not being able to use non-competes. Commenters also stated that employers have alternatives to non-competes that generate less harm to competition, to workers, to the economy, and to rival firms, including NDAs and fixed-term employment contracts.

The Commission declines to adopt an exclusion based on workers' access to trade secrets, confidential business information, or other intellectual capital because it finds such an exclusion would be unnecessary, unjustified, unworkable, and prone to evasion. The Commission finds the use of non-competes to be an unfair method of competition and addresses claimed justifications related to trade secrets, confidential business information, or other intellectual capital in Part IV.D. The Commission finds that protecting trade secrets, confidential information, and other intellectual capital is an insufficient justification for non-competes because employers have less restrictive alternatives for protecting such information. Moreover, if the Commission were to exempt workers with access to confidential information, employers could argue that most or all workers fall under the exception, requiring workers to engage in complex and fact-specific litigation over the protected status of the underlying information. As explained in Part IX.C, such case-by-case adjudication of the enforceability of non-competes has an *in terrorem* effect that would significantly undermine the Commission's objective to address non-competes' tendency to negatively affect competitive conditions in a final rule.

3. Differentiation by Industry Other Than Healthcare

Some businesses and organizations argued that specific industries should be exempt from the final rule. The Commission carefully considered these comments and declines to adopt any industry-based exceptions. The Commission notes that while some commenters characterized purported justifications for an exclusion from the final rule as unique to a particular industry, the purported justifications were in fact the same as the those addressed in Part IV.D, namely, the need to protect investments in labor, trade secrets, confidential business information, or other intellectual capital. The Commission addresses those arguments in full in Part IV.D, but in this Part V.C.3 further discusses examples of comments seeking industry-based exceptions.

a. Client- and Sales-Based Industries

Some commenters in client- or sales-based industries, including real estate and insurance, argued they are unique and should be excluded from any rule. A real estate commenter argued that job switching by real estate employees is similar to the sale of a business where the goodwill and book of business generated by the departing employee must remain with the business. A timeshare industry commenter claimed the industry had unique features justifying the use of non-competes with highly paid workers, such as the cost of marketing and cultivation of relationships to bring in and maintain customers as well as the need to protect proprietary targets and strategies for resort development, due in part to the limited number of available resort contracts. A commenter representing insurance marketing organizations (IMOs), which serve as facilitators between insurance carriers, agents, and consumers similarly argued for an exclusion, citing client goodwill, purported trade secrets in sales methods, sales leads, unique compensation structures, and company analyses, and consumer harm from potential agent misconduct if the agent moves to a new IMO and changes the consumer's policy. Some businesses stated that non-competes rarely impact a worker's ability to find other work in their industry, sometimes because the new employer ''buys out'' the non-compete.

The majority of commenters from the real estate and insurance industry workers and small, independent insurance agencies, supported a comprehensive ban. These comments painted a picture consistent with the Commission's findings in Part IV.B regarding indicia of unfairness, including facial unfairness, and the tendency of non-competes to negatively affect competitive conditions in the labor and product and service markets. A worker from the real estate industry stated that non-competes are standard in the industry for all workers, regardless of their position in a company. Commenters stated that they were asked to sign after starting their job, with one worker stating that they faced the option of either signing the non-compete or leaving and losing future commissions for work they had done. Workers noted that they were terminated without cause and still required to comply with a non-compete, and that they had no bargaining power for promotion or wage increases. The following examples are illustrative of the comments the Commission received:

- As an aspiring entrepreneur in the real estate space, I am in a relatively small market where one company dominates. I recently ended my employment with them. They use non-competes to restrict competition and trap employees. The abolition of non-competes is paramount as small towns/cities grow. . . .[914]
- I signed a non-compete after working at a Real Estate Brokerage for several months. I

[912] *See* Part IV.D.2.

[913] For a more detailed discussion of proposed § 910.1(i), *see* Part IV.C.4.a.

[914] Individual commenter, FTC–2023–0007–10710.

was told I had to sign it or I would not be paid on the transactions I had pending. The non-compete was so overreaching—there was no geographical scope, the penalty was more than prohibitive. I was told that no one really enforces them or attempts to. I signed it, collected my outstanding pay and left the company within 90 days. Fast forward 4 years, I have been defending myself in litigation over this non-compete for over 3 years. Unable to afford qualified representation.[915]

- I am a business owner and have had 40 independent contractors under my business at my peak. They were all under non-compete, and if I could go back, I would eliminate the non-compete. It doesn't help the employee or contractor, and it doesn't help the business either. It spurs an unhealthy work environment. Clogs up the judicial system with frivolous cases where they try and scare people from earning a living. . . . I 100% support this ban, and it should go into effect immediately.[916]

Commenters stated that non-competes are standard in the insurance industry and that the industry is facing significant consolidation, fueled in part by private equity firms. These commenters argued that workers in the insurance industry are prohibited from seeking jobs with higher pay and better benefits in their specialty. Commenters stated that they were not able to negotiate better conditions at their current job and that employers can change the employment terms at will, so workers face reduced commissions and pay while still being held to a non-compete. Commenters stated that insurance agents are highly trained and specialized, and non-competes force them to leave their specialty and start over in a new specialty for less pay. Commenters also argued that non-competes thwart consumer choice because insurance agents create relationships with their customers, and customers lose the ability to choose the same agent if the agent is bound by a non-compete. Commenters also noted that standard employment agreements in the insurance industry require workers to pay their own costs to defend against noncompete litigation even if the worker is successful in the challenge such that even if a worker does not violate the terms of a noncompete, or the noncompete is not enforceable, workers who change jobs or start a new agency are often faced with significant legal bills. Commenters noted that although independent licensing agents are meant to be able to contract with multiple insurance companies, they are heavily restricted by non-competes, creating regional monopolies. The following examples are illustrative of the comments the Commission received:

- As a captive ''Independent Contractor'' for a large insurance company, this rule would be a lifeline should I decide to pursue an independent agent opportunity. The insurance company I represent, has gradually cut commissions over the past few years . . . that makes it extremely uncompetitive compared to peers. There is absolutely no reason why I should be held prisoner and not be able to pursue far more favorable, and beneficial opportunities, for both myself and my family.[917]
- Ideally I would like to start my own insurance agency but am currently prevented from doing so due to a non-compete clause. We are already somewhat limited in employment opportunities here in rural West Texas . . . . I'm finding it difficult to find a path to provide for my family during the two year period [of the non-compete], and therefore am considering scrapping the new business idea and remaining at my current job. . . . In a sense, I feel trapped at my current job, and ultimately I feel hobbled from achieving my full potential as a future small business owner.[918]

The Commission declines to adopt an exclusion for client- or sales-based industries such as real estate and insurance. The use of non-competes is an unfair method of competition and the purported justifications raised by commenters do not change the Commission's finding. The Commission also notes that, to the extent commenters seeking an exception are referencing different restrictive covenants, including some garden variety non-solicitation agreements, which do not prohibit or function to prevent a worker from switching jobs or starting a new business as described in Part III.D, the final rule does not apply to them. Thus, the Commission focuses on commenters' purported need for an exclusion based on non-competes alone.

In response to commenters arguing that information and techniques related to sales, including strategy on developing business, is confidential or proprietary and that workers' ability to move to another job or start a business would thus harm them, the Commission notes that any specific information or truly proprietary techniques can be protected by much less restrictive alternatives, such as trade secret law and NDAs. For example, proprietary targets and strategies for timeshares or unique compensation structures or company analyses cited by IMOs can be otherwise protected. Moreover, companies can compete on the merits to retain their customers by offering better products and services. Requiring workers to leave the industry or the workforce is an overbroad restriction that tends to negatively affect—and actually harms—competition with attendant harm to workers and rivals, as outlined in Part IV.B.

With respect to commenter arguments that non-competes are needed to protect specialization related to particular products and skills related to sales, as the Commission finds in Part IV.D, preventing workers from using their general trade knowledge and skills, including their gains in the same through experience with a particular employer, is not a legally cognizable justification for non-competes. That a real estate, insurance, or any other sales agent inherently learns skills and gains knowledge in the performance of their job, becoming a more effective salesperson over time, is not itself a cognizable justification for preventing the worker from re-entering the labor market as a worker or business owner. Employers' efforts to use non-competes to prevent workers from using general trade knowledge and skills is an unfair method of competition under section 5 because it is an attempt to avoid competition on the merits.[919] To the extent employers seek to protect legitimate investments in training, the Commission finds employers have less restrictive alternatives, including fixed duration contracts and better pay or other terms and conditions of employment to retain the worker. Finally, the Commission notes that because all covered employers can no longer maintain or enforce non-competes with workers who are not senior executives, employers may also have a larger pool of trained and experienced workers to hire from.

The Commission disagrees with commenters arguing that a worker leaving a sales position is akin to the sale of a business. Unlike the seller of a business, a worker is in an unequal bargaining position and does not receive compensation when leaving the firm. The fact that a worker generates goodwill for an employer is not a cognizable justification for non-competes. First, it not clear that the employer would lose goodwill associated with their business if a particular worker leaves. Moreover, commenters do not specify the extent to which their legitimate investment in the worker—separate from employing the

worker to use their general skills and knowledge to successfully perform the job—generates such goodwill. To the extent employers do seek to protect investments in goodwill, the employer has less restrictive alternatives to attract and retain workers and customers or clients.

b. Industries With Apprenticeships or Other Required Training

Some commenters representing industries with apprenticeships or that require training as a part of employment, such as real estate appraisers, plumbers, and veterinarians, argued their industry should be excluded from the final rule. These commenters contended that a significant investment is needed to make workers productive in their industries and that they need to use non-competes to protect that investment. Each commenter cited an apprenticeship or training period during which they are not able to bill or must bill a lower amount for a worker's labor.

Worker commenters from these industries stated that non-competes leave them unable to launch or progress in their career because non-competes tie them to their first employer. Some appraiser commenters noted that, while their share of the appraisal fee rises to some extent after completing their apprenticeship, they cannot negotiate higher shares of the fee or other better working conditions because of non-competes. A union commenter representing plumbers noted that plumbers with non-competes are not able to accept better offers of employment, with better pay and benefits, including union positions. Other worker commenters mentioned geographic overbreadth and excessively long non-competes of two years. Many veterinarian commenters supported the proposed rule, stating that non-competes artificially held down their compensation and did not allow them to start new practices in areas where the need for more veterinary services is great, with some commenters stating that this contributed to consolidation.

The Commission declines to exclude industries, such as real estate appraisal, plumbing, and veterinary medicine, in which an industry must purportedly invest in significant training or apprenticeship of workers before the employer considers them to be productive. The Commission finds that these employers have less restrictive alternatives—namely fixed duration contracts—to protect their investment in worker training. A return on investment in the training does not require that the worker be unable to work for a period after leaving employment. Moreover, employers stand to benefit from the final rule through having access to a broader labor supply—including incoming experienced workers—with fewer frictions in matching with the best worker for the job.

c. Financial Services

Some commenters representing financial services companies opposed the rule, arguing non-competes are necessary for the industry and their industry is unique because non-competes have been used for decades, while numerous firms have entered the market, workers are mobile, and there is no evidence of blocked or curbed entry, lack of access to talent, lower innovation, or other negative impacts in that market. These commenters mention that mobility and access to talent is possible because new employers often ''buy out'' a worker's non-compete to hire a worker who may be otherwise bound by a non-compete. Several commenters also contend that non-competes are especially vital to firms that focus on securities or commodities trading because disclosure of commercially sensitive information to competitors can be extremely damaging to their former employers' profitability.

Commenters identified three studies which they contend suggest that non-competes improve worker productivity. First, commenters identified two studies on the Broker Protocol, an agreement among financial advisory firms which ostensibly limited the use of NDAs, non-solicitation agreements, and non-competes simultaneously. One study by Gurun, Stoffman, and Yonker finds that firms that joined the Protocol experienced higher rates of employee misconduct and earned increased fees.[920] The other study, by Clifford and Gerken, finds that firms which joined the Protocol invested more heavily in licensure and experienced fewer customer complaints.[921] Commenters noted that these two studies have conflicting findings on advisor misconduct. The authors themselves discuss these findings, with each criticizing the approach of the other. One commenter stated that, from a technical standpoint, the Clifford and Gerken study has a superior approach due to its substantially larger sample size and its analysis of the assumptions underlying the methodologies used in both studies. A third study—a study of the mutual fund industry by Cici, Hendriock, and Kempf—finds that mutual fund managers increase their firms' revenue when non-competes are more enforceable by investing in higher performing funds, attracting new clients, and increasing revenue from fees.[922] This study uses three changes in non-compete enforceability, measured in a binary fashion.

A commenter representing a large group of public equity investors supported the rule, stating that a comprehensive ban would create an inclusive labor market, which is integral to long-term corporate value and a dynamic, innovative, and equitable economy. Financial services worker commenters also supported the rule, citing to their failure to be paid for their skills over time, the threat of litigation in seeking new employment, and the overbroad nature of non-competes in the industry. The following example is illustrative of the comments the Commission received:

- I am a female finance professional with strong qualifications and experience. I am subject to an extremely long and comprehensive non compete contract which I was induced to sign at a young age. I have been offered many positions at other firms who would be more willing to provide me with leadership opportunities and a path to further advancement, but I am unable to consider them and I am essentially trapped at my firm. . . .[923]

The Commission declines to exclude financial services companies over which it has jurisdiction from the final rule. The Commission finds in Part IV.C that non-competes are restrictive, exclusionary, and also exploitative and coercive for higher wage and highly skilled workers, including workers in finance. The Commission also finds in Part IV.B and IV.C that non-competes tend to negatively affect competitive conditions in labor market through reduced labor mobility and in the product and services market through reduced innovation and new business formation. Evidence that new employers sometimes buy out non-competes also suggests that such clauses harm competition by raising the cost to compete and creating deadweight economic loss for the new employer.[924]

The empirical evidence provided by commenters arguing for differentiation

[924] *See* Part IV.C.2.c.i.

for the finance industry does not support their claims. The Commission finds that it is difficult to weigh the evidence in the two studies of the Broker Protocol because they reach conflicting results, though the Commission agrees that the technical approach in the Clifford and Gerken study is superior due to its larger sample size. More importantly, both studies primarily concerned non-solicitation agreements, and do not isolate any effects of non-competes. So even if the studies did not reach conflicting results, the Commission believes they still would yield little reliable information about the effects of non-competes specifically. With respect to the study of the mutual fund industry, the Commission notes that under section 5, firms may not justify unfair methods of competition based on pecuniary benefit to themselves.[925] The study does not establish that there were societal benefits from the attraction of new clients or the increased fee revenue—just that the firms benefited. Therefore, this study does not establish a business justification that the Commission considers cognizable under section 5.

d. On-Air Talent

Some commenters opposing the rule stated that investment in on-air talent would be considerably reduced without non-competes. Commenters argued that on-air talent becomes well-known because of employers' investment and reputation and that employers must be able to use non-competes to protect this investment. The Commission also received a number of comments from and on behalf of on-air talent. Those commenters stated that non-competes are ubiquitous for on-air talent, that they are often localized geographically, that they suppress compensation, and that they force workers seeking a better match to move out of their localities. The following example is illustrative of the comments the Commission received:

- I am a professional broadcast journalist subject to a non-compete agreement with every employment contract I have ever signed, which is the industry standard. I understand the need for contractual agreements with on-air talent and some off-air talent, but non-compete agreements have historically offered nothing to employees besides restricting where they work, and how much money they are able to earn . . . [while] knowing that employees would have to completely relocate if they wanted to seek or accept another opportunity.[926]

[925] *Id.*

[926] Individual commenter, FTC–2023–0007–12779.

The Commission declines to exclude on-air talent from the final rule. The Commission finds the use of non-compete agreements is an unfair method of competition as outlined in Part IV.B, and commenters do not provide evidence that a purported reduction in investment in on-air talent would be so great as to overcome that finding. Specifically, the success of on-air talent is a combination of the employer's investment and the talent of the worker, both of which benefit the employer. As noted in Part IV.D, other less restrictive alternatives, including fixed duration contracts and competing on the merits to retain the talent, allow employers to make a return on their own investments. Moreover, as stated in Part II.F, firms may not justify unfair methods of competition based on pecuniary benefit to themselves. Employers in this context do not establish that there are societal benefits from their investment in on-air talent, but only that the firms benefited.

e. Construction

A commenter representing companies who provide skilled workers in construction stated that the Commission should exclude the industry from the rule because non-competes are necessary to the industry's success. The commenter states that non-competes are necessary for investment in innovation and productivity in the industry. The comment cites to three studies. Two of the studies find a general reduction in productivity in construction and conclude, *inter alia,* further study is warranted to better understand the trend—Goolsbee and Syverson [927] and Huang, Chapman, and Burty (''NIST study'' [928]). The third study is a McKinsey & Company report published in 2020 predicting innovation in the construction industry in the coming years.[929]

The evidence cited by this commenter is exclusively about broad trends in productivity in the industry, and what may impact those trends. None of the studies explicitly examines non-competes, and they do not support inferences on the effects of non-competes in this particular industry. Indeed, the Commission finds that the final rule addresses issues raised by the commenter. For example, the commenter notes that productivity in the industry has been broadly declining for years. Notably, this downward trend exists with non-competes in use in the industry. The Commission notes that, under its analysis of the effect of the final rule, productivity will benefit because the final rule frees up labor and allows for greater innovation. The NIST study raises ''skilled labor availability'' as the very first factor that affects productivity. The Commission finds in Part IV that non-competes suppress labor mobility and the Commission believes the final rule will result in firms having access to workers who are a better, more productive fit. The McKinsey & Company report notes that changes in the industry will require adaptation by firms. The Commission believes the final rule will facilitate this adaptation by sharing non-confidential know-how across firms through increased mobility of workers. The rule may also help mitigate, and certainly will not exacerbate, concerns over increased concentration in the industry raised in the McKinsey & Company report, as the Commission finds that non-competes inhibit new business formation in Part IV.B.3.b.i. Moreover, the Commission believes non-competes may increase concentration, as discussed in Part IV.B.3.b.iii.

Additionally, the Commission finds that less restrictive alternatives, including appropriately tailored NDAs and non-solicitation agreements, are sufficient to address disclosure of confidential information and concerns related to client business. With respect to concerns that the construction industry as a whole is suffering from under-investment in capital and that the final rule may further disincentivize capital investment, as the Commission finds in Part IV.B.3.b.i, non-competes inhibit new business formation. The increase in new business formation from the final rule will bring new capital to bear in the industry. The Commission addresses the empirical literature and comments related to capital investment in detail Part IV.D.1. The Commission notes here that it is not clear any purported capital investment associated with non-competes is entirely beneficial because it may be the result of firms over-investing in capital because they do not face competition on the merits. Even if there is some net decrease in capital investment due to the final rule, commenters provide no reason to believe it would be a material amount.

4. Exclusion for Covered Market Participants That Have Competitors Outside the FTC's Jurisdiction

The Commission explained in the NPRM that some entities that would otherwise be employers may not be subject to the final rule to the extent they are exempted from coverage under the FTC Act.[930] As described in Part II.E.1, the Act exempts, *inter alia,* ''banks,'' ''persons, partnerships, or corporations insofar as they are subject to the Packers and Stockyards Act of 1921'' [931] as well as an entity that is not ''organized to carry on business for its own profit or that of its members.'' [932] A few business and trade organization commenters argued the Commission should rescind the proposal or should not promulgate the rule because limits on the Commission's jurisdiction mean that the rule will distort competitive conditions where coverage by the final rule may not be universal. These commenters identified industries where employers excluded from the Commission's jurisdiction compete with covered persons, including livestock and meatpacking industries, and areas where government or private employers subject to the State action doctrine compete with covered employers. They contended that excluded employers will be able to use non-competes while their covered competitors are legally prohibited from doing so, advantaging excluded employers.

The Commission declines to rescind the proposal or otherwise refrain from promulgating a rule simply because the rule would not cover firms outside the Commission's jurisdiction. As an initial matter, jurisdictional limits are not unique to the Commission. All agencies have limits on their jurisdiction—many of which do not neatly map to all competitors in a particular market. Moreover, as explained in Parts IV and X, the final rule will have substantial benefits notwithstanding the FTC Act's jurisdictional limits, including increases in worker earnings, new firm formation, competition, innovation, and a decrease in health care prices (and potentially other prices). Furthermore, the Commission finds the risk of material disparate impact in markets where some but not all employers are covered by the final rule is minimal and, in any event, the final rule's overall benefits justify any such potential impact. As commenters acknowledged, excluded employers already compete with covered employers in the same markets. That is, coverage under the FTC Act—whether an employer is subject to the FTC Act and enforcement by the FTC—differs across a range of topics and long predates this final rule, which does not materially alter the status quo in that respect. Moreover, even in the absence of the rule, firms within the jurisdiction of the FTC Act are already subject to potential FTC enforcement against unfair methods of competition, including against non-competes, while firms outside the FTC's jurisdiction are not. The final rule does not alter that basic landscape.

At least one financial services industry commenter stated that national banks are outside of the Commission's jurisdiction and argued the final rule should exclude bank holding companies, subsidiaries, and other affiliates of Federally regulated banks to avoid disparate treatment of workers employed by different affiliates within the same organization, and because those entities are already heavily regulated. The Commission declines to exclude bank holding companies, subsidiaries, and other affiliates of Federally regulated banks that fall within the Commission's jurisdiction. While these institutions may be highly regulated, and depending on the corporate structure non-competes may be allowed for some workers but not others, the Commission finds that neither factor justifies excluding them from the final rule. If Federally regulated banks are concerned about disparate treatment of workers employed by their own different affiliates, they have the option to stop using non-competes across all their affiliates.

A corporation wholly owned by an Indian tribe asserted that the Commission should exclude Indian tribes and their wholly owned business entities from the definition of ''employer.'' The commenter asserted that the FTC Act does not explicitly grant jurisdiction over Indian tribes and their corporate arms. The commenter further argued that critical tribal revenue will be lost if tribal businesses' ability to retain skilled workers is impacted. The Commission declines to categorically exclude tribes or tribal businesses from coverage under the final rule. The FTC Act is a law of general applicability that applies to Indians, Indian Tribes, and tribal businesses.[933] The Commission recognizes, however, that in some instances these entities may be organized in such a way that they are outside the Commission's jurisdiction.[934] Whether a given Tribe or tribal business is a corporation within the FTC Act will be a fact-dependent inquiry. The Commission is aware of no evidence suggesting the final rule would disproportionately impact tribes or tribal businesses.[935]

5. Coverage of Healthcare Industry

Many commenters representing healthcare organizations and industry trade associations stated the Commission should exclude some or all of the healthcare industry from the rule because they believe it is uniquely situated in various ways. The Commission declines to adopt an exception specifically for the healthcare industry. The Commission is not persuaded that the healthcare industry is uniquely situated in a way that justifies an exemption from the final rule. The Commission finds use of non-competes to be an unfair method of competition that tends to negatively affect labor and product and services markets, including in this vital industry; the Commission also specifically finds that non-competes increase healthcare costs. Moreover, the Commission is unconvinced that prohibiting the use of non-competes in the healthcare industry will have the claimed negative effects.

a. Comments Received

Many business and trade industry commenters from the healthcare industry seeking an exception,

[930] NPRM at 3510.

[934] *See, e.g., AMG Servs.,* 2013 WL 7870795, at *22 (finding genuine dispute of material fact barring summary judgment on question of whether tribal chartered corporations were corporations under the FTC Act).

[935] The commenter also asked the Commission to engage Indian tribes about the proposed rule, citing Executive Order 13175. However, the Commission notes that Executive Order 13175, which requires consultation with Indian Tribes before promulgating certain rules, does not apply to independent regulatory agencies such as the Commission. E.O. No. 13175, 65 FR 67249 (Nov. 6, 2000) (stating that the term ''agency,'' which governs the applicability of the executive order, excludes agencies ''considered to be independent regulatory agencies, as defined in 44 U.S.C. 3502(5)''); 44 U.S.C. 3502(5) (listing the Commission as an ''independent regulatory agency''). The Commission did, however, provide extensive opportunities for public input from any and all stakeholders, including a 120-day comment period (extended from 90 days) and a public forum held on February 16, 2023, that provided an opportunity to directly share experiences with non-competes.

including, for example, hospitals, physician practices, and surgery centers, focused on whether the Commission has jurisdiction to regulate nonprofit entities registered under section 501(c) of the Internal Revenue Code. The Commission addresses its jurisdiction in Part II.E and considers comments related to requests for an industry-based exclusion for all or part of the healthcare industry in this section. As stated in Part II.E, entities claiming tax exempt status are not categorically beyond the Commission's jurisdiction, but the Commission recognizes that not all entities in the healthcare industry fall under its jurisdiction.

Based on the assumption that entities claiming tax-exempt status as nonprofits and publicly owned healthcare organizations would be exempt, many industry commenters contended that for-profit healthcare organizations must be also exempted from the rule as a matter of equal treatment. Commenters cited data from the American Hospital Association (AHA) indicating that as many as 58% of all U.S. hospital systems claim tax-exempt status as nonprofits, 24% are for-profit hospitals, and 19% are State and local government hospitals. One commenter cited AHA data indicating that 78.8% of for-profit hospitals are located in the same Hospital Referral Region (HRR) as at least one entity that claims tax-exempt status as a nonprofit. Many commenters argued that for-profit entities and entities that claim nonprofit status compete for patients, physician and non-physician staff, and market share. These commenters contended that a rule covering only for-profit healthcare entities will distort the market in favor of entities claiming tax-exempt status as nonprofits, which would continue using non-competes. One commenter identifying as an entity claiming nonprofit tax-exempt status argued that such entities need to rely on non-competes to compete with for-profit competitors because, unlike for-profit health systems, they invest significantly in specialized training and mentorship, and offer a guaranteed minimum salary to recent graduates.

Some commenters contended that favoring entities claiming tax-exempt status as nonprofits would have negative effects. Some commenters argued that disparate coverage under the rule may exacerbate consolidation in the healthcare industry by advantaging entities that claim tax-exempt status as nonprofits. They stated that increased consolidation would reduce the available supply of skilled labor for for-profit hospitals, increasing labor costs and contributing to higher prices paid by patients. Commenters noted a trend in physicians increasingly leaving private practice to work at large hospital groups claiming tax-exempt status as nonprofits, which, they contended, may continue to lock those physicians up using non-competes. Industry commenters also argued that insurance premiums will rise more than they would absent the rule because of the greater market power and resulting leverage of entities that claim tax-exempt status as nonprofits in provider network negotiations. One manufacturing industry association commenter argued that the burden of rising premiums will be passed on to manufacturers who provide health insurance to their employees.

Commenters also argued that a rule covering for-profit healthcare providers would cause independent, physician-owned practices, and small community practices to suffer a competitive disadvantage compared to larger entities that claim tax-exempt status as nonprofits and public hospital groups, reducing the number of these practices and interrupting continuity of care for their patients. Commenters stated that such practices will suffer these consequences acutely in States or localities that are particularly saturated with entities that claim tax-exempt status as nonprofits or exempt State or local hospitals, and cited New York and Mississippi as examples. A commenter claimed that public hospitals regulated by the Commission will incur losses because of their reduced ability to hire and retain physicians that perform profitable procedures. One commenter cited a 1996 Commission study to contend that, all else equal, hospitals that claim tax-exempt status as nonprofits set higher prices when they have more market power. A business commenter contended that, given what they considered a large-scale exemption of certain physician employers from the Commission's jurisdiction, the States are more appropriate regulators of non-competes between physicians and employers. Other commenters claimed that the Commission must further study the consequences of differential treatment.

Conversely, many commenters vociferously opposed exempting entities that claim tax-exempt status as nonprofits from coverage under the final rule. Several commenters contended that, in practice, many entities that claim tax-exempt status as nonprofits are in fact ''organized to carry on business for [their] own profit or that of [their] members'' such that they are ''corporations'' under the FTC Act. These commenters cited reports by investigative journalists to contend that some hospitals claiming tax-exempt status as nonprofits have excess revenue and operate like for-profit entities. A few commenters stated that consolidation in the healthcare industry is largely driven by entities that claim tax-exempt status as nonprofits as opposed to their for-profit competitors, which are sometimes forced to consolidate to compete with the larger hospital groups that claim tax-exempt status as nonprofits. Commenters also contended that many hospitals claiming tax-exempt status as nonprofits use self-serving interpretations of the IRS's ''community benefit'' standard to fulfill requirements for tax exemption, suggesting that the best way to address unfairness and consolidation in the healthcare industry is to strictly enforce the IRS's standards and to remove the tax-exempt status of organizations that do not comply. An academic commenter argued that the distinction between for-profit hospitals and nonprofit hospitals has become less clear over time, and that the Commission should presumptively treat hospitals claiming nonprofit tax-exempt status as operating for profit unless they can establish that they fall outside of the Commission's jurisdiction.

The Commission also received many comments about coverage of the health care sector generally under the rule. Some commenters urged the Commission to ensure that health care workers, including doctors and physicians, were covered by the final rule. Several commenters stated that eliminating non-competes would allow doctors wishing to change jobs to stay in the same geographic area, fostering patient choice and improving continuity of care. Other commenters urged the Commission to create an exception for health care workers. Some argued that the evidence does not support the Commission's conclusion that non-competes depress earnings in health care. Other reasons commenters cited in support of an exception included concerns about continuity and quality of care for patients, the increased costs for employers of health care workers, physicians' negotiating power with their employers, and the effect on incentives for employers to train their health care workers.[936]

Thousands of healthcare workers submitted comments supporting a ban on non-competes. Worker commenters

[936] Some commenters also contended that the health care industry should be exempt from the rule because many health care providers fall outside of the Commission's jurisdiction. The Commission summarizes and responds to those commenters in Part II.E.2.

did not always identify whether they were working at for-profit organizations, entities that claim tax-exempt status as nonprofits, or State or local healthcare organizations, but each category was represented in the comments. These commenters detailed the negative effects of non-competes on their families, their mental health, their financial health, and their career advancement, as elaborated in Part IV.B.2.b.ii. Specifically, healthcare workers commented that because non-competes prohibited them from switching jobs or starting their own businesses, they had to stay at jobs with unsafe and hostile working conditions, to take jobs with long commutes, to relocate their families, to give up training opportunities, and to abandon patients who wanted to continue seeing them. Illustrative comments are highlighted in Parts I and IV.

Additionally, commenters stated the hardship patients have suffered because of non-competes when, for example, their physician was required to move out of their area to work for a different employer. The Commission highlights some of these comments in Part IV.B.2.b.ii and includes two further illustrative comments here:

- As a patient, non compete clauses are affecting mine and my [family's] ability to receive medical care. Our pediatrician left a practice and we aren't able to be informed where they are going. When we find out, it is an hour away [because] of the non compete. And when we look for other [doctors] closer they aren't accepting new patients. So for an entire year we are driving 2 [hours] round trip to see our pediatrician until they can move back to a local medical group. The non compete clause is not just affecting the life of the [doctor], but is also impacting many of us who rely on their services.[937]
- As a family physician this has caused much grief and obstructs my desire to work and provide care for underserved populations. I am a NHSC scholarship recipient and due to non compete clauses was unable to continue working in the town I served due to its rurality. This created a maternity desert in the region I served. Now in a more metropolitan area, there has been an exodus of physicians in the area due to non compete clauses that has caused worsening access to primary care, specialty services, including behavioral health and substance use disorder treatment.[938]

A number of physician group commenters stated that nonprofit healthcare organizations regularly impose non-competes on physicians, and that the impact of the rule would be limited if nonprofits are not required to comply. Some physician group commenters urged the Commission to work with other agencies to fill in gaps in applying the rule based on the Commission's jurisdiction, citing the importance of banning non-competes as widely as possible because of the harms they impose on physicians and patients irrespective of employer status. Specifically, commenters suggested that the Commission use its antitrust and referral authority to aggressively monitor nonprofit organizations for antitrust violations, to collaborate with other Federal agencies, including the IRS, and to provide incentives and guidance to States, which can enact measures to ensure that a prohibition on non-competes is implemented comprehensively. One commenter also noted that a ban would bring scrutiny to non-competes and would likely intensify pressure to eliminate them. A few commenters also contended that entities claiming tax-exempt status as nonprofits are subject to the Commission's jurisdiction as ''persons'' under the FTC Act.

b. The Final Rule

After carefully considering commenters' arguments, the Commission declines to exempt for-profit healthcare employers or to exempt the healthcare industry altogether.

First, as described in Part IV, the Commission finds that certain uses of non-competes are an unfair method of competition. The use of unfair methods of competition cannot be justified on the basis that it provides a firm with pecuniary benefits to help them compete with other firms that use similar tactics.[939] In this case, for-profit and other covered entities have urged the Commission to allow them to continue to employ an unfair method of competition (*i.e.,* use non-competes) because some competitors are not prohibited from doing so as they are beyond the Commission's jurisdiction. The Commission is committed to stopping unlawful conduct to the full extent of its jurisdiction. For example, the Commission would not refrain from seeking to enjoin unlawful price fixing by a for-profit within its jurisdiction because entities outside its jurisdiction under the FTC Act would not be subject to the same FTC action.

Second, the Commission disagrees with commenters' contention that all hospitals and healthcare entities claiming tax-exempt status as nonprofits necessarily fall outside the Commission's jurisdiction and, thus, the final rule's purview. As explained in Part II.E.2, a corporation's ''tax-exempt status is certainly one factor to be considered,'' but that status is not coterminous with the FTC's jurisdiction and therefore ''does not obviate the relevance of further inquiry into a [corporation's] operations and goals.'' [940] Accordingly, as noted by commenters, entities that claim tax-exempt nonprofit status may in fact fall under the Commission's jurisdiction. Similarly, whether the final rule would apply to quasi-public entities or certain private entities that partner with States or localities, such as hospitals affiliated with or run in collaboration with States or localities, depends on whether the particular entity or action is an act of the State itself under the State action doctrine, which is a well-established, fact-specific inquiry.[941] Thus, some portion of the 58% of hospitals that claim tax-exempt status as nonprofits and the 19% of hospitals that are identified as State or local government hospitals in the data cited by AHA likely fall under the Commission's jurisdiction and the final rule's purview. Further, many States have banned non-competes for a variety of healthcare professionals in both for-profit and nonprofits entities by statute.[942] Even if

Continued

the final rule's coverage extends only to hospitals that do not identify as tax-exempt non-profits based on AHA data, as explained in Part IV.A.1, the Commission finds every use of covered non-competes to be an unfair method of competition and concludes that the evidence supports the Commission's decision to promulgate this final rule, which covers the healthcare industry to the full extent of the Commission's authority.

Relatedly, in response to commenters' concern that large numbers of healthcare workers will not benefit from the final rule because they work for entities that the final rule does not cover, the Commission notes many workers at hospitals, including those that claims tax-exempt status as a nonprofit or government-owned hospital, contract with or otherwise work for a for-profit entity, such as a staffing agency or physician group. Although some of these individuals may work at an excluded hospital, the final rule applies to their employer—the staffing agency or for-profit physician group—because it is covered by the final rule.

The Commission disagrees with commenters stating the ability to use non-competes will provide a material competitive advantage to entities claiming tax-exempt status as nonprofit or publicly owned entities that are beyond the Commission's jurisdiction. To the contrary, those entities outside FTC jurisdiction that continue to deploy non-competes may be at a self-inflicted disadvantage in their ability to recruit workers, even if they derive some short-term benefit from trapping current workers in their employment. Furthermore, commenters' concern that for-profit healthcare entities will be at a competitive disadvantage is based on the false premise that entities outside the jurisdiction of the FTC will not be otherwise regulated or scrutinized with respect to the use of non-competes. States currently regulate non-competes by statute, regulation, and common law. According to the AHA data cited by commenters, over 12% (398/3,113) of nonprofit hospitals and 13% of government hospitals (187/1,409) are in States that ban non-competes for all employers. In any event, even if true, arguments that for-profit and other covered entities could suffer competitive harm by not being able to employ an unfair method of competition would not change the Commission's finding that use of certain non-competes is an unfair method of competition, as further discussed in Part IV.

While the Commission shares commenters' concerns about consolidation in healthcare, it disagrees with commenters' contention that the purported competitive disadvantage to for-profit entities stemming from the final rule would exacerbate this problem. As some commenters stated, the Commission notes that hospitals claiming tax-exempt status as nonprofits are under increasing public scrutiny. Public and private studies and reports reveal that some such hospitals are operating to maximize profits, paying multi-million-dollar salaries to executives, deploying aggressive collection tactics with low-income patients, and spending less on community benefits than they receive in tax exemptions.[943] Economic studies by FTC staff demonstrate that these hospitals can and do exercise market power and raise prices similar to for-profit hospitals.[944] Thus, as courts have recognized, the tax-exempt status as nonprofits of merging hospitals does not mitigate the potential for harm to competitive conditions.[945]

Commenters provide no empirical evidence, and the Commission is unaware of any such evidence, to support the theory that prohibiting non-competes would increase consolidation or raise prices. To the contrary, as elaborated in Parts IV.B.3.a and IV.B.3.b, the empirical literature suggests, and the Commission finds, that the final rule will increase competition and efficiency in healthcare markets, as workers at for-profit healthcare entities will be able to spin off new practices or work for different employers where their productivity is greater. This is true even if the Commission does not reach some portion of healthcare entities. While the Commission's prior research may indicate, as one commenter suggested, that nonprofit hospitals set higher prices when they have more market power, the Commission finds that the final rule is not likely to increase healthcare prices

competes for several types of healthcare practitioners); Tex. Bus. & Com. Code secs. 15.50–.52 (Texas statute restricting the use of non-competes for physicians).

through this same mechanism because it is unlikely to lead to significant increases in healthcare nonprofits' market share, if at all.

Moreover, the Commission has other tools to address consolidation in healthcare markets and is committed to using them. The Clayton Act grants the Commission authority to enforce compliance with, *inter alia,* section 7 of the Clayton Act. The Clayton Act does not include any carveout for entities that are nonprofit or otherwise do not operate for profit—and the FTC's jurisdictional limit based on the definition of ''corporation'' in the FTC Act does not apply in this context.[946] Accordingly, the Commission has authority under the Clayton Act to review and challenge mergers and acquisitions involving healthcare entities or hospitals regardless of nonprofit status.[947] Thus, even if the jurisdictional limitations of the final rule were to somehow incentivize some hospitals and other healthcare entities claiming non-profit status to consolidate, the Commission will continue to scrutinize those mergers and work with State partners to vigorously defend competition.[948] For the same reason, the Commission disagrees with commenters who contended that the effects of consolidation and staffing shortages will be worse in areas highly saturated with nonprofits claiming tax-exempt status.

Finally, the Commission disagrees with commenters that stated the Commission must further study the final rule's effect on healthcare workers and entities. The Commission has specific, long-time expertise in the healthcare market as anticompetitive mergers and conduct in healthcare markets have long been a focus of FTC law enforcement, research, and advocacy.[949] This work includes economic analyses of the effects of mergers involving nonprofit hospitals and studies of the impacts of hospital mergers.[950] Accordingly, given this expertise and the extensive record in the rulemaking, the Commission finds it has sufficient understanding of healthcare markets and that the evidence supports the final rule's application to the healthcare industry.

6. Coverage of Franchisors Vis-à-Vis Franchisees

a. The Proposed Rule

The Commission proposed to exclude franchisees from the definition of ''worker'' and requested comment on whether and to what extent the rule should cover non-competes between franchisors and franchisees (''franchisor/franchisee non-competes'').[951] The Commission explained that it proposed to exclude franchisees from the definition of ''worker'' because, in some cases, the relationship between a franchisor and franchisee may be more analogous to the relationship between two businesses than the relationship between an employer and a worker.[952] The Commission also noted that the evidentiary record relates primarily to non-competes that arise out of employment. However, the Commission stated that, in some cases, franchisor/franchisee non-competes may present concerns under section 5 similar to the concerns presented by non-competes between employers and workers and sought comment on coverage of franchisor/franchisee non-competes.[953]

b. Comments Received

Many commenters requested that the final rule cover franchisor/franchisee non-competes. Numerous commenters contended the franchisee-franchisor relationship is closer to a relationship between a worker and an employer than a relationship between businesses. These commenters argued that franchisees are often individual business owners who, like workers, lack bargaining power to negotiate over non-competes. One commenter stated that the Commission acknowledged in the Franchise Rule that franchisees generally lack bargaining power.[954] Several commenters, including industry commenters representing franchisees, argued that franchisees tend to suffer even greater power imbalances than workers because many risk significant personal assets to start their franchises. According to these commenters, this risk places acute strain on franchisees' bargaining leverage when negotiating to renew franchise agreements because, if they choose to reject a new agreement, they not only lose the opportunity to continue working in the same field due to their non-compete, but also the value of their investment.

Commenters seeking coverage of franchisor/franchisee non-competes also stated that these non-competes do not protect legitimate interests because franchisors generally do not entrust franchisees with trade secrets or details about their broader commercial strategy. These commenters stated that, even if franchisees do receive such information, franchisors have less restrictive alternatives for protecting it, including NDAs and trade secret law. Some commenters also stated that non-competes have anticompetitive effects because franchisors may degrade the quality of inputs or raise input prices without fearing that their existing franchisees will leave for a competitor.

Many franchisee commenters also stated their desire to compete after exiting their franchise relationships. Franchisees also stated that their non-competes harm their negotiating position in bargaining over franchise renewal terms. These franchisees stated that franchisors can impose higher royalty rates or other less favorable terms over time as the franchisees feel powerless to refuse or make effective counteroffers, due to their non-competes. Many franchisees asserted that their non-competes are overbroad because they restrain individual owners' spouses and other close relatives from competing in the same industry. Some franchisees stated that their non-competes include penalties for choosing

not to renew their contracts even if they do not compete.

Other commenters, primarily franchisors and trade organizations, stated that franchisor/franchisee non-competes should be excluded from the final rule. Many of these commenters argued that franchisor/franchisee non-competes are more similar to restrictive covenants between businesses than non-competes between employers and workers. Some of these commenters argued that franchisor/franchisee non-competes are more justified than non-competes in the employment context because, unlike employment relationships, entering into a franchise agreement is completely voluntary. Some commenters argued that, unlike non-competes in the employment context, franchisor/franchisee non-competes are only entered into by individuals with access to substantial capital and who therefore always have the option of starting their own businesses.

Many of these commenters argued that prohibiting non-competes for franchisees would threaten to severely disrupt or destroy the franchise business model, and that this would harm franchisors and franchisees alike, as franchising offers a unique opportunity for working people to become entrepreneurs with established brands. Commenters asserted non-competes are critical to the franchise business model because they offer both franchisors and franchisees confidence that existing franchisees will likely stay with a brand and refrain from using a franchise's trade secrets to unfairly compete against the franchisor. Commenters also asserted that franchisees are often exposed to proprietary information through training manuals and operational support and that non-competes help protect this information. In addition, commenters contended franchisor/franchisee non-competes protect investments made by other franchisees and maintain a franchise's goodwill.

Commenters supporting the exclusion of franchisor/franchisee non-competes from the final rule also asserted that the Commission lacked an evidentiary basis for covering such non-competes. These commenters also claimed no State has prohibited non-competes for franchisees, and the Commission would therefore lack data from natural experiments to justify extending a final rule to the franchise context.

c. The Final Rule

The Commission continues to believe that, as many commenters attested, franchisor/franchisee non-competes may in some cases present concerns under section 5 similar to the concerns presented by non-competes between employers and workers. The comments from franchisors, franchisees, and others provide the Commission with further information about non-competes in the context of the franchisor/franchisee relationship, but the evidentiary record before the Commission continues to relate primarily to non-competes that arise out of employment. Accordingly, the final rule does not cover franchisor/franchisee non-competes. Non-competes used in the context of franchisor/franchisee relationships remain subject to State common law and Federal and State antitrust laws, including section 5 of the FTC Act.

VI. Section 910.4: Relation to State Laws and Preservation of State Authority and Private Rights of Action

In proposed § 910.4, the Commission addressed State laws and preemption. Based on comments, the Commission adopts a modified provision clarifying and explaining that States may continue to enforce laws that restrict non-competes and do not conflict with the final rule, even if the scope of the State restrictions is narrower than the final rule.[955]

A. The Proposed Rule

The NPRM contained an express preemption provision, proposed § 910.4, that explained the proposed rule preempted State laws inconsistent with the rule and did not preempt State laws that offer greater protection than the rule. The NPRM explained that when a State law offers greater protection than the rule, employers would be able to comply with both the NPRM and the State law. Thus, the proposed rule would have established a regulatory floor, but not a ceiling. The NPRM provided two hypothetical examples, one of a State law that would be inconsistent with, and therefore preempted by, proposed § 910.2(a) and one that would not because it satisfied the savings clause by offering greater protection and was not inconsistent with proposed part 910.[956]

B. Authority for Preemption

Numerous commenters supported the preemption of inconsistent State laws. Some commenters asserted the Commission lacks the legal authority to preempt State laws, including State common law, on non-competes because Congress allegedly did not confer the necessary authority to the Commission or because of federalism principles. They argued there must be clear Congressional intent to preempt State laws relating to non-competes.[957] Numerous commenters asserted the Commission lacks clear authority from Congress to preempt State laws on non-competes, arguing the FTC's statutory authority neither expressly nor impliedly authorizes preemption of non-competes. Commenters made similar points based on cases about the preemptive force of the Commission's UDAP regulations. For example, one commenter asserted the FTC may not have the authority to preempt less restrictive State laws, citing *American Optometric Association* v. *FTC,* in which the court noted the need for congressional authorization for the Commission to preempt an entire field of State laws that arise from the State's police powers.[958]

The Commission finds it has the authority to promulgate regulations that preempt inconsistent State laws under section 6(g), together with section 5, of the FTC Act. Even without an express preemption provision, Federal statutes and regulations preempt conflicting State laws. Under the Supreme Court's conflict preemption doctrine, a Federal statute or regulation impliedly preempts State laws when it is impossible for the regulated parties to comply with both the Federal and the State law, or when a State law is an obstacle to achieving the full purposes and objectives of the Federal law.[959] ''Federal regulations have no less pre-emptive effect than Federal statutes.'' [960] Indeed, even commenters who questioned the FTC's authority to preempt State laws agreed that if a Federal agency promulgates a rule pursuant to its Congressionally conferred authority, the rule preempts conflicting State laws.

As discussed in Parts II.A, II.B, and II.C, the Commission has the authority to promulgate this final rule. Accordingly, the final rule preempts conflicting State laws. To provide a clear explanation of the Commission's intent and the scope of preemption effected by the final rule, the final rule includes an express preemption

[955] State statutes, regulations, orders, or interpretations, including State common law, are referred to as ''State laws'' for ease of reference.

[956] NPRM at 3515.

[957] Comments on the Commission's authority to promulgate this final rule, separate from the issue of preemption of State law, are summarized in Part II.

[958] *Am. Optometric Ass'n* v. *FTC,* 626 F.2d 896, 910 (1980).

[960] *Fid. Fed. Sav. & Loan Ass'n* v. *de la Cuesta,* 458 U.S. 141, 153 (1982).

provision at § 910.4.[961] As discussed in Part VI.D, the Commission has modified proposed § 910.4 to make clear that even when the scope of non-compete prohibitions under a State law is less than that of the final rule, State authorities and persons may enforce the State law by, for example, bringing actions against non-competes that are illegal under the State law.

C. The Benefits of Preemption

Numerous commenters stated that variations in State laws chill worker mobility and expressed support for a uniform Federal standard. Some commenters explained that a preemption clause could bring clarity to the law's effect.

The U.S. Department of Justice commented that, due to the patchwork of State laws, a worker may be free to switch jobs in one jurisdiction but subject to a non-compete in another, creating uncertainty as to the non-compete's enforceability for both firms and workers.[962] In another commenter's view, the variation in State non-compete laws creates competitive disadvantages for companies in States that ban such clauses, necessitating a Federal ban.

Another commenter pointed out that most States have not passed statutes that ban or restrict non-competes, and that existing statutes cover different categories of workers and different wage levels, making it difficult for workers to know whether employers can enforce a particular non-compete. The commenter stated that variations in the legal authority of State attorneys general to take action on the public's behalf also limit the effectiveness of State restrictions on non-competes. A number of commenters explained that the difficulties arising from variations in State non-compete laws are exacerbated by the increase in remote and hybrid work, and workers who travel to work across State lines. Accordingly, many commenters favored a uniform Federal standard that would promote certainty for employers and workers. Even some commenters who generally opposed banning non-competes favored preemption to eliminate the patchwork of State laws that makes it difficult for workers to know the applicable law and encourages forum shopping by employers who want to bring suits in sympathetic jurisdictions.

Other commenters opposed preemption, asserting that State legislatures and courts are best situated to address non-competes and that the States have historically regulated this area. They contended States should be allowed to continue adjusting the scope of restrictions on non-competes including applicability to different types of workers, time span, and geographic scope.

The Commission finds that preemption of State laws, including State common law, that conflict with the final rule best mitigates the negative effects of the patchwork of State laws, including chilling worker mobility and undercutting competitive conditions in labor and product and services markets.[963] Preempting this patchwork with a Federal floor is particularly important given the increase in work across State lines, and remote and hybrid work, since the COVID–19 pandemic.

Moreover, as discussed in Part IX.C, preemption furthers a primary goal of the final rule: to provide a uniform, high level of protection for competition that is easy for both employers and workers to understand and makes it less likely that employers will subject workers to illegal non-competes or forum shop. Indeed, some commenters who otherwise opposed the proposed ban on non-competes regarded the patchwork itself burdensome to employers as well as workers and noted the rule would reduce burden by eliminating uncertainty and confusion caused by State law variations.[964] As described in Part IX.C, the Commission has determined that declining to issue this final rule and continuing to rely solely on State laws and case-by-case adjudication would be less effective than issuing a clear national standard. The Commission concludes, however, that supplementing the final rule with additional State authority and resources, so long as the State laws are not inconsistent with the final rule, will assist in protecting both workers and competition.

D. The Extent of Preemption

Some commenters strongly supported the NPRM but expressed concern that the preemption provision as proposed could undermine States' efforts to curb non-competes and would thereby undercut the final rule's effectiveness. These commenters stated that under one interpretation, proposed § 910.4 could preempt State laws that prohibit non-competes for workers earning less than a specified income because the law as a whole may not be deemed to provide greater protection than the final rule. In their view, such an interpretation would not further the final rule's goals, because States with income-based restrictions on non-competes rather than complete bans may offer covered workers protections against non-competes that the FTC's proposed rule would not provide, such as State enforcement, private rights of action, and certain financial penalties.[965]

These commenters also asserted that in many cases, State agencies and residents could be better positioned to respond to unlawful non-compete use specific to a particular State, but they would be unable to do so and dependent on the Commission if their laws were fully preempted. To enable concurrent enforcement of State laws that restrict the use of non-competes, thereby increasing the enforcement resources devoted to the issue, they recommended a ''savings clause'' that would exempt from preemption State laws that provide workers with protections substantially similar to or greater than those afforded by the

[961] Many FTC regulations, including regulations promulgated under section 6(g) of the FTC Act, include provisions addressing State laws and preemption. *See, e.g.,* Funeral Rule, 16 CFR 453.9 (exempting from preemption State laws that ''afford an *overall* level of protection that is *as great as, or greater than,* the protection afforded by'' the FTC's Rule) (emphasis added); Concerning Cooling Off Period for Sales Made at Homes or at Certain Other Locations, 16 CFR 429.2(b) (exempting laws and ordinances that provide ''a right to cancel a door-to-door sale that is *substantially the same or greater* than that provided in this part'') (emphasis added); Business Opportunity Rule, 16 CFR 437.9(b) (''The FTC does not intend to preempt the business opportunity sales practices laws of any [S]tate or local government, except to the extent of any conflict with this part. A law is not in conflict with this Rule if it affords prospective purchasers *equal or greater protection*[.]'') (emphasis added); Mail, internet, or Telephone Order Merchandise Rule, 16 CFR 435.3(b) (''This part does supersede those provisions of any State law, municipal ordinance, or other local regulation which are inconsistent with this part to the extent that those provisions do not provide a buyer with rights which are *equal to or greater* than those rights granted a buyer by this part.'') (emphasis added); Franchise Rule, 16 CFR 436.10(b) (''The FTC does not intend to preempt the franchise practices laws of any [S]tate or local government, except to the extent of any inconsistency with part 436. A law is not inconsistent with part 436 if it affords prospective franchisees *equal or greater protection*[.]'') (emphasis added); Labeling and Advertising of Home Insulation, 16 CFR 460.24(b) (preemption of ''State and local laws and regulations that are inconsistent with, or frustrate the purposes of this regulation''). *See also* Part II.B.

[963] *See* Part IX.C.

[964] *See, e.g.,* Comment of Mech. Contractors Ass'n of Am., FTC–2023–0007–18218 (although opposed to the proposed rule, MCCA's position supports a single Federal rule and some level of preemption).

[965] *See* Comment of the Attys. Gen. of 17 States and DC, FTC–2023–0007–21043, at 14–15 (''jurisdictions like Colorado, Illinois, Washington, and the District of Columbia have passed laws that ban non-competes for workers making under a specified income threshold and also include remedies provisions that authorize [S]tate agencies and residents to enforce the law''); *id.* at 9–11 (discussing State enforcement, private action, and damages in several State non-compete laws).

rule.[966] They also recommended that the rule not preempt State antitrust and consumer protection laws that may protect workers against non-competes and other restrictive employment arrangements as those laws can provide another enforcement avenue for State agencies and residents.

Another commenter recommended including a narrow reverse preemption provision so that relevant State laws in States that enact the Uniform Restrictive Employment Agreement Act[967] would not be preempted.[968] The comment asserted that by doing so, a final rule would preserve a role for the States and encourage their cooperation with the Commission, and also provide greater protections for employees than the proposed rule provided in several ways, such as allowing for greater enforcement and including classes of employers that the final rule would not cover.[969] The uniform law would ban non-competes for workers earning at or below the State's annual mean wage and would allow non-competes for those earning more, but apply limits and require disclosures for any non-compete.

Based on comments, the Commission has modified the final rule's preemption provision to clarify and explain that State laws that restrict non-competes and do not conflict with the final rule are not preempted. Section 910.4 also expressly references State common law, antitrust law, and consumer protection law, so that the intended scope of preemption is clear. State common law is expressly referenced because many States do not have a general non-compete statute, and the common law varies considerably.

Section 910.4(b) reflects the Commission's intent that States may continue to enforce in parallel laws that restrict non-competes and do not conflict with the final rule, even if the scope of the State restrictions is narrower than that of the final rule. That is, State laws cannot authorize non-competes that are prohibited under this final rule, but States may, for example, continue to pursue enforcement actions under their laws prohibiting non-competes even if the State laws prohibit a narrower subset of non-competes than this rule prohibits.

Accordingly, § 910.4(a) states that the final rule will not be construed to annul, or exempt any person from complying with, any State statute, regulation, order, or interpretation applicable to a non-compete, including, but not limited to, State antitrust and consumer protection laws and State common law. Rather, the final rule supersedes such laws to the extent, and only to the extent, that such laws would otherwise permit or authorize a person to engage in conduct that is an unfair method of competition under § 910.2(a) or conflict with the notice requirement in § 910.2(b).[970] These revisions provide that when States have restricted non-competes and their laws do not conflict with the final rule, employers must adhere to both provisions, and workers are protected by both provisions (including State restrictions and penalties that exceed those in Federal law).

For example, § 910.4 makes clear that the final rule does not preempt State law enforcement where a State bans non-competes only for workers earning below a certain amount and thus has a ban that is narrower than the final rule. Thus, if a State's law bars non-competes only for workers who earn less than $150,000 per year, the final rule and the law are different in scope of protection but not directly inconsistent. The State may continue to enforce its ban for workers earning less than $150,000, but all non-competes covered by the final rule, regardless of a worker's earnings, remain an unfair method of competition under the final rule and are therefore unlawful.

In response to concerns raised by commenters and to further bolster the consistent use of State laws, the Commission expressly recognizes State authority and the existence of private rights of action arising under State laws that restrict non-competes or bar unfair methods of competition. This is set forth in § 910.4, now titled ''Relation to State laws and preservation of State authority and private rights of action,'' and is detailed in § 910.4(b). That section provides that unless a State law conflicts with the final rule and is superseded as described in § 910.4(a), part 910 does not limit or affect the authority of State attorneys general and other State agencies or the rights of a person to bring a claim or regulatory action arising under State laws, including State antitrust and consumer protection laws and State common law. Section 910.4(b) also explains that persons retain the right to bring a claim or regulatory action under State laws unless the laws conflict with the final rule and have been superseded as described in § 910.4(a).

These modifications are consistent with many commenters' recommendations and recognize State-based enforcement as a potent force that supplements Federal enforcement. In addition, the modifications, particularly those that explain § 910.4 does not exempt any person from complying with State laws, are intended to curb the use of preemption as a defense against State restrictions of non-competes.[971] Under the final rule, States may continue to play a critical role in restricting the use of non-competes. In contrast to the FTC Act, which cannot be enforced by private persons or State authorities,[972] the non-compete laws of numerous States provide for such enforcement.[973] Non-competes that are outside the FTC's jurisdiction or otherwise outside the scope of the final rule may be covered by State non-compete laws.[974] State penalties can be substantial and may be particularly important as a deterrent.

The modifications also reflect the Commission's long history of working in concert with States and encouraging concurrent enforcement of State laws to pursue common goals. While the Commission recognizes this will leave some variation in the enforcement exposure covered persons face among States, that variation will be greatly reduced by the final rule, which sets a

[966] Another comment recommended a similar formulation, which would exempt from preemption State laws that offer workers protection that is equal to or greater than the protection provided by the final rule. This commenter asserted that this formulation would allow existing State law to stand.

Ann. sec. 181.988, subdiv. 1 (b) (''''Employer' means any individual, partnership, association, corporation, business, trust, or any person or group of persons acting directly or indirectly in the interest of an employer in relation to an employee.'').

floor that applies nationally.[975] As it has done in the past, the Commission will ''share the field'' with States and partner with them in the battle against abusive non-competes.[976] As set out in Part IX.C, the Commission considered and rejected the alternative of relying on existing State laws alone. Consistent with that determination, the Commission declines to adopt the suggestion from a comment that relevant State laws in States that enact the Uniform Restrictive Employment Agreement Act not be preempted.

VII. Section 910.5: Severability

The Commission stated in the NPRM that it may adopt a severability clause[977] and it received a comment stating the Commission should adopt such a clause to protect the rights and securities of workers if one part of the rule or one category of workers were invalidated. The Commission adds § 910.5, together with this section, to clarify the Commission's intent.[978]

Section 910.5 states that if any provision of the final rule is held to be invalid or unenforceable either facially, or as applied to any person or circumstance, or stayed pending further agency action, such invalidity shall not affect the application of the provision to other persons or circumstances or the validity or application of other provisions. Section 910.5 also states that if any provision or application of the final rule is held to be invalid or unenforceable, the provision or application shall be severable from the final rule and shall not affect the remainder thereof. This provision confirms the Commission's intent that the remainder of the final rule remain in effect in the event that a reviewing court stays or invalidates any provision, any part of any provision, or any application of the rule—including, for example, an aspect of the terms and conditions defined as non-competes, one or more of the particular restrictions on non-competes, or the standards for or application to one or more categories of workers.

The Commission finds that each of the provisions, parts of the provisions, and applications of the final rule operate independently and that the evidence and findings supporting each provision, part of each provision, and application of each provision stand independent of one another. In this final rule, the Commission determines that certain conduct is an unfair method of competition in Part IV.B and Part IV.C and differentiates between senior executives and workers who are not senior executives with respect to existing non-competes. The final rule distinguishes between the two in both the final rule's operation and in the bases for adopting the final rule. The difference in restrictions among different workers, and the distinct bases for adopting the restrictions, is described in detail in Parts IV.B and IV.C. The Commission also estimates the effect of excluding senior executives entirely from the rule in Part X.F.11 and finds that the benefits of covering only those workers who are not senior executives justify the costs.

The Commission promulgates each provision, part of each provision, and application of each provision as a valid exercise of its legal authority. Were any provision, part of any provision, or any application of any provision of the final rule stayed or held inapplicable to a particular category of workers, to particular conduct, or to particular circumstances, the Commission intends the remaining elements or applications of the final rule to prohibit a non-compete between covered persons and covered workers as an unfair method of competition.

In Parts IV.B and IV.C, the Commission finds that the use of non-competes is an unlawful unfair method of competition under section 5 of the FTC Act because it is restrictive and exclusionary conduct that tends to negatively affect competitive conditions in several independent ways. In support of its finding that the use of non-competes is an unlawful unfair method of competition for workers who are not senior executives, the Commission additionally finds that the use of non-competes is exploitative and coercive in Part IV.B.2.b.

The Commission relies principally on empirical evidence regarding the effects of changes in non-compete enforceability, both when finding in Part IV.B.3.a and Part IV.C.2.c.ii that the use of non-competes tends to negatively affect competitive conditions in labor markets, and when finding in Part IV.B.3.b and Part IV.C.2.c.i that the use of non-competes tends to negatively affect competitive conditions in product and service markets. The Commission further analyzes and quantifies these effects in Part X.F.6, including sensitivity analyses that compare the estimated effects of smaller changes in enforceability and larger changes in enforceability.

Based on this empirical evidence and analysis, the Commission believes that more limited application of the rule—which might result were a court to render the final rule inapplicable in some way—may be equivalent to smaller changes in the enforceability of non-competes in the empirical literature. As described in Part IV.B.3.a and IV.B.3.b, smaller changes in enforceability change the magnitude, but not the directional nature, of the labor market and product and service market effects.[979] Accordingly, consistent with the findings related to the use of certain non-competes being an unfair method of competition in Part IV, the empirical evidence on the use of non-competes, the regulatory impact analysis in Part X, and its expertise, the Commission finds that any smaller reduction in enforceability resulting from circumstances in which a court stays or invalidates some application of the final rule would not impair the function of the remaining parts of the final rule nor would it undermine the justification or necessity for the final rule as applied to other persons, conduct, or circumstances. The Commission intends for any remaining application of the final rule to be in force because it is committed to stopping any and all unlawful conduct related to the use of certain non-competes and the Commission finds every use of a non-compete covered by the final rule to be an unlawful unfair method of competition under section 5 of the FTC Act.[980]

In Part X, the Commission conducts a regulatory impact analysis for the final rule as applied to all workers, as applied to all workers other than senior executives, and as applied to senior executives. The Commission finds that the asserted benefits of the use of non-competes do not justify the harms from the use of non-competes for any category of workers. The Commission's findings and differential analysis demonstrate that the asserted benefits from the use of non-competes do not justify the harms from the use of non-competes for higher- or lower-wage earners, including, for example, lower-wage workers defined as workers whose total annual compensation is less than $151,164.

[975] The Commission has taken this position in previous regulations. *See, e.g.,* Part 429—Cooling-Off Period for Door-to-Door Sales, 37 FR 22934 (Oct. 26, 1972).

[976] For a previous example, *see* Trade Regulation Rule; Funeral Industry Practices, 47 FR 42260, 42287 (Sept 24, 1982) (noting the purpose of the rule's provision addressing relation of the rule to State law is ''to encourage [F]ederal-[S]tate cooperation by permitting appropriate [S]tate agencies to enforce their own [S]tate laws that are equal to or more stringent than the trade regulation rule'').

[977] NPRM at 3518–19 & n.429.

[978] In the NPRM, proposed § 910.5 addressed the compliance date.

[979] *See also* Part X.F.6.

[980] *See* NPRM at 3518–19.

For instance, if, for any reason, a reviewing court were to stay or invalidate the final rule as applied to senior executives, the Commission would intend for the remainder of the final rule to apply to all workers other than senior executives. Likewise, if a reviewing court were to stay or invalidate the final rule to apply to workers other than senior executives, the Commission would intend for the remainder of the final rule to apply to senior executives. Additionally, if a reviewing court were to stay or invalidate the final rule as applied to some other subset of workers, the Commission would intend for the remainder of the final rule to apply to all but those workers. So, for example, if a reviewing court were to stay or invalidate the final rule as applied to workers other than lower-wage workers—defined as workers whose total annual compensation is less than $151,164—the Commission would intend for the remainder of the final rule to apply to those workers, and further notes the evidentiary record demonstrates that application of the rule to those remaining workers would be beneficial and achieve lawful objectives. In the same way, if a reviewing court were to stay or invalidate the provision of the final rule regarding enforcing an existing non-compete or the notice requirement, the Commission would intend for the remainder of the final rule to apply. As described in Part IX.C, although the Commission concludes that a national standard is most effective, a number of States currently apply different standards to different workers and States also apply a myriad of legal standards to non-competes generally. Accordingly, were a reviewing court to stay or invalidate a particular application of the final rule, a covered person could simply comply with the provisions, parts of provisions, or applications of the final rule that remain in effect.

The Commission's adoption of the final rule does not hinge on the same restrictions applying to all non-competes, on the final rule applying to all workers, or on joint adoption or operation of each provision. Accordingly, the Commission considers each of the provisions adopted in the final rule to be severable, both within each provision and from other provisions in part 910. In the event of a stay or invalidation of any provision, any part of any provision, or of any provision as it applies to certain conduct or workers, the Commission's intent is to otherwise preserve and enforce the final rule to the fullest possible extent.

VIII. Section 910.6: Effective Date

The Commission adopts a uniform effective date of 120 days after publication of the final rule in the **Federal Register**. The final rule will go into effect, and compliance with the final rule will be required, on that date. Based on comments urging the Commission to reduce the compliance period from the 180-day period proposed in the NPRM so that the benefits of the final rule may be obtained as soon as possible, the Commission's findings that the use of non-competes is exploitative and coercive for the vast majority of workers, and modifications in the final rule that reduce covered entities' compliance burden, the Commission modifies the date that compliance with the final rule is required from 180 days to 120 days after publication in the **Federal Register**.

A. The Proposed Rule

In the NPRM the Commission proposed a compliance date of 180 days after publication of the final rule in the **Federal Register**. The Commission stated that, during the compliance period, employers would need to: (1) assess whether to implement replacements for existing non-competes (such as NDAs), draft those covenants, and then negotiate and enter into those covenants with the relevant workers; (2) remove any non-competes from employment contracts that they provide to new workers; and (3) rescind, no later than the date that compliance is required, any non-competes that it entered into prior to the compliance date.[981] The Commission preliminarily found that 180 days would be enough time for employers to accomplish all of these tasks.[982] The NPRM would have also required employers to provide the notice specified in proposed § 910.2(b)(2) within 45 days of rescinding the non-compete.[983]

The Commission also stated that it proposed to establish an effective date of 60 days after the final rule is published in the **Federal Register** even though compliance would not be required for 180 days.

[981] *Id.* at 3483, 3515–16. In the NPRM and herein, the Commission refers to the period between the publication of the final rule and the date on which compliance with the final rule is required as the ''compliance period.'' *See id.* at 3515.

[982] *Id.* at 3516.

[983] *Id.* (addressing compliance with proposed § 910.2(b)(2)).

B. Comments Received

Many worker commenters urged the Commission to act as quickly as possible to bring the final rule into force, citing the current acute, ongoing harms to their earnings, mobility, quality of life, and other significant impacts and noting the final rule's potential for immediate relief if their non-compete was no longer in force. Representatives of many local governments from different States contended that the negative effects of non-competes and the anticipated benefits of the proposed rule justified allowing the Commission's rule to go into effect as soon as possible. Other commenters supported the compliance date as proposed or favored other measures to obtain the anticipated benefits of the final rule as soon as practicable. Another commenter contended that the 180-day compliance period was sufficient to allow businesses to ensure compliance and suggested that the Commission move the effective date back to the day or the day after the final rule is published.[984]

Several commenters suggested the Commission adopt a longer compliance period of one year, 18 months, or two years. These commenters generally stated that businesses need more time to adjust their compensation packages, contracting practices, and employee policies to comply with the rule and to protect their intellectual property. At least one commenter also argued the Commission should adopt a two-year compliance period to allow courts sufficient time to hear and resolve challenges to the final rule. One commenter asserted that the compliance period would be especially burdensome for smaller business. Another industry commenter argued application of the rule should be phased in over time.

C. The Final Rule

The Commission adopts a 120-day compliance period. As outlined in Parts IV.B and IV.C, based on both voluminous comments from the public as well as a significant body of empirical evidence, the Commission finds that the use of non-competes is coercive and exploitative for the vast majority of workers across different earnings levels and occupations and that for all workers it tends to negatively affect competitive conditions in labor markets and also tends to negatively affect competitive conditions in product and service markets—and that such actual harms are in fact currently ongoing. The Commission adopts a 120-

[984] The comment did not consider the limitations on the effective date imposed by the CRA.

day compliance period to stop these unfair methods of competition as soon as practicable. The Commission finds that a 120-day period appropriately balances the interests at hand.

The Commission has taken several steps in the final rule to make compliance as simple as possible for employers. These steps make it practicable and reasonable to require compliance within 120 days. The final rule allows regulated entities to enforce existing non-competes with senior executives, who commenters contended are most likely to have complex compensation arrangements that include non-competes. Accordingly, there is no need for a lengthy compliance period, as the most complex existing arrangements are left in place. The Commission also eliminated the rescission requirement for all workers. Under the final rule, employers will not need to rescind (*i.e.,* legally modify) existing non-competes for any workers; rather, employers will simply be prohibited from enforcing them after the effective date of the final rule and will be required to provide the notice in § 910.2(b)(1).[985] While employers are required to provide notice to workers with existing non-competes who are not senior executives, under § 910.2(b), the final rule provides model safe harbor language that satisfies the notice requirement.[986] The final rule gives employers several options for providing the notice—on paper, by mail, by email, or by text.[987] And employers are exempt from the notice requirement where the employer has no record of a street address, email address, or mobile telephone number for the worker.[988] Furthermore, as explained in Part IV.E, the Commission has simplified the notice requirement to facilitate employers' ability to comply by simply sending a mass communication such as a mass email to current and former workers.

Starting on the effective date of the final rule, employers will be prohibited from entering into new non-competes barred by this final rule and from enforcing non-competes that the employer entered into prior to that date with workers other than senior executives. Prior to the effective date employers will need to identify each of their workers with existing non-compete agreements and can assess which, if any, are senior executives and determine if they wish to maintain those non-competes. Employers will also need to assess and revise, if necessary, any employment policies or handbooks that purport to bind workers even after the effective date.

To the extent they have confidential business information, trade secrets, or other investments to protect with respect to a particular worker, employers will be able to assess their options to lawfully protect that information. However, new protections will be unnecessary in many cases, because, for example, 95.6% of workers subject to non-competes are already subject to an NDA.[989] In the rare case where compensation might be tied to a non-compete that is not with a senior executive, the employer and worker can determine whether to amend their original employment agreement. The Commission concludes that the 120-day compliance period gives employers more than sufficient time to complete these tasks. For example, firms routinely complete entire onboarding processes for new employees in much shorter timeframes than 120 days.

The Commission also finds that the 120-day compliance period gives small businesses enough time to comply with the final rule. Although small businesses may have limited staff and funds compared to larger firms, they also have fewer workers, and the exclusion for existing non-competes for senior executives will relieve the compliance burden altogether for those small firms that use non-competes only with those workers. Moreover, the steps the Commission has taken to reduce the compliance burden of § 910.2(b) will further simplify and streamline compliance for small businesses.

The Commission has also determined it is not necessary to extend the compliance period to give courts time to adjudicate pending non-compete litigation because, as described in Part V.C.3, the Commission has adopted § 910.3(b), which provides that the final rule does not apply where a cause of action related to a non-compete arose prior to the effective date. The Commission also finds that a longer compliance period is not needed to hear and resolve challenges to the final rule, especially given the ability of a challenger to seek a preliminary injunction.

In sum, the Commission finds that due to modifications reducing covered entities' burden to comply with the final rule, a compliance period of 120 days is sufficient time to comply with the final rule. Given these changes the longer compliance period proposed in the NPRM is no longer warranted and would allow the use of certain non-competes that are an unfair method of competition—and their related harms and costs—to continue for longer than necessary. The substantial benefits to competition and to workers of the final rule taking effect as soon as possible outweigh any concerns about potential difficulties in meeting an earlier compliance date.

The Commission also adopts a 120-day effective date. The Commission concludes that it would ease the burden of implementation and reduce possible confusion by having a uniform date for when the final rule goes into effect and when compliance under the final rule is required. A 120-day effective date complies with the requirements of the Congressional Review Act that a ''major rule'' may not take effect fewer than 60 days after the rule is published in the **Federal Register**.

IX. Alternative Policy Options Considered

The Commission proposed to ban non-competes categorically, with a limited exception for non-competes entered into by a person who is selling a business entity. In the NPRM, the Commission discussed and sought comment on potential alternatives to the proposed categorical ban, including discrete alternatives that would implement a rebuttable presumption of unlawfulness or apply different standards to different categories of workers.[990] The Commission also sought comment on whether a rule should apply a different standard to senior executives, and whether, in lieu of the proposed rule, the Commission should adopt a disclosure rule or reporting rule.[991] The Commission sought comment on all aspects of potential alternatives, including whether the Commission should adopt one of the identified alternatives or some other alternative instead of the proposed rule.[992] The Commission also sought comment on the extent to which a uniform Federal standard for non-competes would promote certainty for employers and workers.[993]

The Commission received many comments on these questions, as well as on the question of whether the Commission should issue a Federal standard for non-competes or continue relying on existing law and case-by-case litigation to address harms from non-

competes. In this section, the Commission discusses the comments received regarding these alternatives and the reasons it has decided not to adopt them. This Part IX addresses these comments but does not address alternatives related to the design of specific regulatory provisions, which are discussed in the Part addressing the relevant provision.

A. Categorical Ban vs. Rebuttable Presumption

1. The Rebuttable Presumption Alternative Generally

While preliminarily finding that a categorical ban would best achieve the proposed rule's objectives, the Commission nevertheless sought comment on the alternative of a rebuttable presumption, under which it would be presumptively unlawful for an employer to use a non-compete, but a non-compete would be permitted if the employer could meet a certain evidentiary burden or standard.[994] The Commission also sought feedback on the form any rebuttable presumption should take.[995]

Most commenters that addressed this issue, including those both supporting and opposing the proposed rule, discouraged the Commission from including a rebuttable presumption in the final rule. These commenters contended that a rebuttable presumption would add complexity and uncertainty to the rule.

Supporters of the proposed rule asserted that a rebuttable presumption would undermine the rule's effectiveness, failing to deter employers from imposing non-competes while making litigation too uncertain and costly for most workers to pursue. Some of these commenters contended that a rebuttable presumption would also do little to reduce the chilling effects of non-competes. They argued that employers would continue to impose non-competes that are unlikely to survive a rebuttable presumption.

Many commenters critical of the proposed rule opposed a rebuttable presumption for essentially the same reasons they opposed the rule in general. They contended that, in States where non-competes are generally enforceable, a rebuttable presumption would inappropriately shift the burden of proof from workers to employers. Many of these commenters specifically opposed a rebuttable presumption that would use a test similar to antitrust law's ''quick look'' analysis, contending that the Commission's analysis of empirical research on non-competes cannot substitute for the lengthy experience courts usually have with a particular restraint before giving it quick-look treatment. A few commenters contended that a rebuttable presumption would increase litigation and raise employers' compliance costs by complicating the determination of whether a given non-compete is likely valid, requiring more lawyer involvement in drafting clauses and more reliance on courts to determine a non-compete's validity.

A few commenters supported a rebuttable presumption, arguing the Commission's proposed ban on non-competes was too blunt an instrument. Some also contended that a rebuttable presumption would offer a more flexible approach akin to the majority of State law approaches. At least one commenter stated a rebuttable presumption would make the final rule more likely to survive judicial review. A few commenters stated a rebuttable presumption would provide more protections than most State laws by allowing only non-competes that the commenter contended are not unfair to the worker, such as where highly paid workers agree to narrow non-competes in exchange for bargained-for consideration. One commenter argued a rebuttable presumption would enable the Commission to accrue more experience adjudicating non-competes and assessing their impact on competition.

Commenters advocating for a rebuttable presumption generally preferred a test focusing on one or more factors, including: the non-compete's geographic scope and duration; the presence and amount of any liquidated damages or penalty provision; whether the clause is narrowly tailored to prevent competition with actual competitors; the restrained worker's duties and income; and the availability of less restrictive alternatives. A few commenters supported a ''preponderance'' (as opposed to a ''clear and convincing'') standard to permit as many non-competes as possible but acknowledged that such a rule may be so similar to the existing common law as to be redundant.

After carefully reviewing and considering the comments, the Commission concludes that a rule implementing a rebuttable presumption is not preferrable to the final rule as adopted. Based on the Commission's expertise, including careful review and consideration of the entire rulemaking record, the Commission finds that a rebuttable presumption would be less effective than the final rule for achieving the Commission's stated goals. A rebuttable presumption also presents administrability concerns that the final rule does not.

Overall, the comments reinforced the Commission's concerns that a rebuttable presumption would foster substantial uncertainty about the validity of a given non-compete and would do little to reduce the *in terrorem* effects of non-competes. Research demonstrates that employers maintain non-competes even where they likely cannot enforce them,[996] that many workers are not aware of the applicable law governing non-competes or their rights under those laws,[997] and that the degree to which non-competes inhibit worker mobility is affected not only by whether a non-compete is actually enforceable but also on whether a worker believes their employer may enforce it.[998] Accordingly, the Commission concludes that a rule implementing a rebuttable presumption would be inadequate to reduce the prevalence of non-competes, their chilling effect on worker mobility, or their tendency to negatively affect competitive conditions. Relatedly, the Commission believes a rebuttable presumption would increase litigation costs for workers and employers relative to the final rule as adopted.

The Commission also believes that, in important respects, a rebuttable presumption for non-competes is inconsistent with the Commission's findings in this final rule. As discussed in greater detail in Part IX.C, a rule that provides for case-by-case, individualized assessment of non-competes is unlikely to address the negative effects of non-competes on competition in the aggregate. In addition, by focusing on considerations specific to the worker and the employer, a rebuttable presumption is unlikely to address the external effects of non-competes (*i.e.,* the effects on persons other than the parties to the non-compete), including their negative effects on the earnings of workers who are not covered by non-competes.

The Commission recognizes there may be some benefits to a rebuttable presumption relative to the status quo. Because it puts the burden of proof on employers, a rebuttable resumption would be stricter than the current law in States where non-competes are allowed, and research suggests even a small decrease in enforceability would increase worker mobility, raise wages,

[998] Starr, Prescott, & Bishara, *supra* note 68 at 633, 652, 664.

and promote innovation.[999] But the categorical ban adopted in the final rule would have greater benefits in these respects without the drawbacks explained in this Part IX.A.1.

2. Discrete Alternatives Related to Rebuttable Presumptions

In the NPRM, the Commission also sought comment on four discrete alternatives to the proposed rule: Alternative #1 (categorical ban below some threshold, rebuttable presumption above); Alternative #2 (categorical ban below some threshold, no requirements above); Alternative #3 (rebuttable presumption for all workers); and Alternative #4 (rebuttable presumption below some threshold, no requirements above).[1000]

As explained in Part IX.A.1, the Commission finds a rebuttable presumption would be ineffective in addressing the harms to competitive conditions caused by non-competes. For the same reasons, the Commission declines to adopt Alternatives #1, #3, and #4, all of which contemplated a rebuttable presumption for some or all workers.

While the vast majority of commenters supported the Commission's proposal to ban non-competes categorically for all workers, a number of commenters suggested that the Commission permit non-competes with senior executives (or other highly skilled or highly paid workers) and other workers. The Commission addresses these comments in Part IV.C and V.D.1, where it finds that such non-competes tend to negatively affect competitive conditions in labor markets and in product and service markets, and that non-competes are also exploitative and coercive for workers other than senior executives. For these reasons, the Commission declines to adopt Alternative #2, which contemplated imposing no requirements on workers above a certain wage or other threshold.

B. Other Discrete Alternatives

1. Disclosure Rule

In the NPRM, the Commission sought comment on the potential alternative of adopting disclosure requirements related to non-competes.[1001] The Commission explained that the rule could, for example, require an employer to disclose to a worker prior to making an employment offer that the worker will be subject to a non-compete and/or to explain the terms of the non-compete and how the worker would be affected by signing it.[1002] The Commission noted that a 2021 study by Starr, Prescott, and Bishara finds that disclosure of non-competes to workers prior to the acceptance of a job offer was associated with increased earnings, rates of training, and job satisfaction.[1003] The authors of the study, however, cautioned that their analysis ''should not be interpreted causally,'' a point the Commission noted in explaining why it gave minimal weight to the study.[1004] The Commission preliminarily concluded in the NPRM that a disclosure requirement would not achieve the objectives of the proposed rule.[1005]

In general, commenters stated they agreed with the Commission's preliminary view that, while there may be some benefits to a disclosure rule, it would not achieve the objectives of the rule. Workers and worker advocacy groups stated that non-competes are often presented to workers on their first day on the job, or after they accept an employment offer. Although these commenters generally supported a comprehensive ban, they noted that if the Commission did not pursue a ban, a disclosure requirement may help improve workers' awareness of non-competes before accepting an offer. On the other hand, these commenters contended that a disclosure rule would do little to reduce the prevalence of non-competes, because workers have little choice but to accept non-competes, which are typically presented as ''take-it-or-leave-it'' terms and are ubiquitous in many fields.

Many trade organizations, advocacy groups, and academics who were generally supportive of the rule stated that a disclosure rule would fail to mitigate the competitive harms caused by non-competes in the aggregate. While acknowledging a disclosure rule may ameliorate some problems related to worker awareness of non-competes, these commenters contended that non-competes are unfair and coercive because employees generally lack adequate bargaining power to refuse to sign or bargain over non-competes even when they are presented at the time of an employment offer, and that a disclosure rule would therefore not have the effect of making non-competes less unfair or coercive. A few commenters opposed a disclosure rule generally but urged the Commission to adopt a disclosure requirement for any non-competes permitted by the final rule, including for any non-competes entered into by a person who is selling a business.

On the other hand, some trade organizations, advocacy groups, and businesses that generally opposed the rule advocated for the Commission to adopt a disclosure rule in lieu of the proposed categorical ban. These commenters contended that a disclosure rule would substantially mitigate the unfairness of non-competes that are entered into without adequate notice to the worker without drastically altering the legal status quo, thereby maintaining the protections for trade secrets, training expenditures, and intellectual property they contend that non-competes provide. They stated that eight States and the District of Columbia have statutory notice requirements for non-competes.

Most of the commenters who supported a disclosure rule also argued that rather than demonstrating that non-competes tend to negatively affect competitive conditions, the available evidence merely demonstrates opportunistic behavior by employers (such as presenting non-competes only after prospective workers have taken hard-to-reverse steps towards accepting employment) and workers (such as seeking to be excused from a non-compete after recognizing its impact on future job prospects). These commenters asserted that a disclosure rule would be better suited to address these types of opportunistic behaviors than a categorical ban.

Some commenters based their support for a disclosure rule on their contention that workers have sufficient bargaining power to negotiate over non-competes when they are provided with notice of them. One such commenter pointed to the cited research by Starr, Prescott, and Bishara finding that disclosure of non-competes to workers prior to acceptance of a job offer may increase earnings, increase rates of training, and increase job satisfaction.[1006] The commenter also referenced the study's finding that of those workers who did not attempt to negotiate a non-compete, 52% reported that they thought the terms were reasonable and 41% reported that they assumed the terms to be non-

[1006] Starr, Prescott, & Bishara, *supra* note 68 at 75.

negotiable.[1007] The commenter contended that a disclosure rule would decrease the number of workers who assumed non-competes were non-negotiable.

A few commenters contended a disclosure rule may be more likely to withstand judicial review because the Commission could promulgate a disclosure rule in this context under its UDAP authority pursuant to the Magnuson-Moss Act. In addition, a few commenters requested the Commission adopt timing rules for when the disclosure must be provided, such as by requiring that employers disclose a non-compete in the job advertisement, at the time of the job offer, or at least five business days prior to the worker's deadline to sign an employment agreement.

The Commission declines to adopt a disclosure rule.[1008] The Commission finds that merely ensuring workers are informed about non-competes would not address the negative externalities non-competes impose on workers, rivals, and consumers. As described in Part IV.B.3.a.ii, non-competes suppress wages for workers across the labor force, including workers who are not subject to non-competes. Ensuring that a worker who enters into a non-compete is informed about the non-compete does not address the harm to these other workers. In addition, it does not address the ways in which non-competes harm consumers and the economy through reduced new business formation and innovation, described in Part IV.B.3.b. In other words, non-competes have negative spillover effects on workers, consumers, businesses, and the economy that disclosure cannot remediate.

The Commission also finds that a disclosure requirement would not be as effective as a categorical ban in addressing the exploitation and coercion of workers through non-competes. As described in Part IV.B.2.b.i, there is a significant imbalance in bargaining power between employers and most workers, which is particularly acute in the context of negotiating employment terms such as non-competes. And, as many comments from workers and worker advocacy groups attest, non-competes are often included in standard-form contracts and offered on a take-it-or-leave-it basis.[1009] As a result, workers have limited practical ability to negotiate non-competes even if they are notified of such clauses prior to accepting their employment offer. Indeed, as described in Part IV.B.2.b.i, the comment record reflects that very few workers (other than senior executives) bargain over their non-competes—whether the worker knew about the non-compete before the job offer and understood its terms, or not.

The Commission gives the findings of the Starr, Prescott, and Bishara study on the impacts of disclosure little weight because the study reflects only correlation, not causation, with respect to the effects of a disclosure rule (similar to the ''use'' studies the Commission gives little weight to, as described in Part IV.A.2). The study merely compares a set of workers whose firms disclosed the non-compete and workers whose firms did not, and any correlation may thus be attributable to confounding factors. This comparison—similar to comparisons of workers with and without non-competes—may be polluted by differences between firms that opt to disclose non-competes and those that do not, or differences between workers who are the beneficiaries of disclosure versus those who are not.[1010] For example, it is possible that firms that disclose non-competes are also more responsible employers in general that tend to pay their workers more, train their workers more, and have more satisfied workers. The Commission therefore does not find that this evidence represents a causal relationship between the disclosure of non-competes and earnings and other outcomes. Moreover, the weight of the evidence discussed in Parts IV.B and IV.C finding increased earnings, new business formation, and innovation from the final rule significantly surpass the potential effects of disclosing non-competes.

One commenter stated that the Starr, Prescott, and Bishara study suggests that a disclosure rule would decrease the number of workers who assume a non-compete with which they are presented is non-negotiable. The study suggests that the potential effects of a disclosure rule in this respect would be, at best, limited.[1011] For the reasons described in this Part IX.B.1, the Commission is skeptical that a disclosure requirement would meaningfully increase the share of workers who actually bargain over non-competes.

A disclosure rule may address some deceptive or misleading practices in connection with non-competes. However, considering that a disclosure rule is not likely to significantly reduce the negative competitive impacts of non-competes on labor markets and on product and service markets, this benefit is significantly outweighed by the limitations of a disclosure rule.[1012]

The Commission further concludes that a disclosure rule is not necessary for non-competes in the context of sales of a business entity. As described in Part V.A, persons selling a business entity tend to have bargaining power in the context of the transaction, and the Commission is unaware of evidence that deceptive and misleading practices in connection with non-competes (such as waiting to disclose a non-compete until after the job offer) are common with respect to business sales.

2. Reporting Rule

In the NPRM, the Commission sought comment on a reporting rule as a potential alternative to the proposed rule.[1013] The Commission stated that it could require employers to report certain information to the Commission relating to their use of non-competes; for example, employers that use non-competes could be required to submit a copy of the non-compete to the Commission.[1014] As the Commission explained, a reporting rule might enable the Commission to monitor the use of non-competes and could potentially discourage employers from using non-competes that are not clearly justified under existing law.[1015]

The Commission stated in the NPRM that it did not believe a reporting rule would achieve the objectives of the proposed rule. The Commission stated that merely requiring employers to report their non-competes to the Commission would not meaningfully reduce the prevalence of non-competes and would therefore fail to reduce the negative effects non-competes have on competitive conditions in labor markets and product and service markets.[1016] At the same time, the Commission stated that a reporting rule would impose

[1007] *Id.* at 72.

[1008] The Commission notes that the Franchise Rule requires franchisors to disclose any non-compete that franchisees must impose on managers. 16 CFR 436.5(o)(3). These non-competes are prohibited by the final rule. *See* Parts III.D and V.D.6.

[1009] *See* Part IV.B.2.b.i.

[1010] Indeed, the authors of this study note that ''unobservables may more plausibly account for these estimates.'' *See* Starr, Prescott, & Bishara, *supra* note 68 at 77 n.35.

[1011] *Id.* at 72. The study finds that 38% of workers asked to sign a non-compete before accepting a job offer assumed they could not negotiate, versus 48% of workers asked after accepting a job offer.

[1012] The Commission considered whether a disclosure rule would be appropriate for senior executives, but concludes that it is not because it would fail to address many of the ways in which non-competes are restrictive and exclusionary and tend to negatively affect competitive conditions.

[1013] *Id.* at 3521.

[1014] *Id.*

[1015] *Id.*

[1016] *Id.*

significant and recurring compliance costs on employers.[1017]

Most commenters addressing this topic agreed with the Commission's preliminary view that a reporting rule would not achieve the goals of the proposed rule. At least one business opposed any reporting requirement due to the cost of compliance and to avoid exposing any confidential information contained in employment agreements. At the same time, some commenters stated that a reporting rule may assist enforcement and provide quantitative data sets to measure compliance, while recognizing that such benefits would lose significance if the Commission were to adopt the proposed rule. One commenter suggested that, to improve the effectiveness of any reporting rule, any such rule should include a provision stating that any non-competes which were not properly disclosed to State and Federal authorities are null and void.

The Commission declines to adopt a reporting rule. A reporting rule would impose recurring compliance costs on employers, compared with the proposed rule, which largely imposes one-time costs. At the same time, a reporting rule would be inadequate to address the negative effects of non-competes on competitive conditions in labor markets and product and service markets, or the Commission's concerns about exploitation and coercion through the use of non-competes, since it would allow for the continued use of non-competes.

3. Limitations on Scope and Duration

In addition to those alternatives listed in the NPRM, a few commenters suggested adopting an alternative rule that allows non-competes but sets a limitation on their geographic scope and/or duration. Some commenters suggested a geographic limit of five, ten, or thirty miles and/or a temporal limit of six months or one, two, or three years, while others suggested a fact-specific requirement that the geographic scope or duration of a non-compete be ''reasonable.'' Many of these commenters cited State laws that take a similar approach.

A few commenters opposed this alternative. One worker advocacy group argued that any bright-line limit may end up serving as a default, encouraging employers to impose non-competes of the maximum allowable scope or duration even if that limit is longer or broader than they otherwise would have imposed. At least one academic commenter argued that setting geographic scope or duration limitations on non-competes is unlikely to have a substantial impact, pointing to the continued prevalence of overly broad non-competes despite State laws designed to set upper limits on geographic scope and duration.

The Commission declines to adopt a standard providing that the geographic scope or duration of non-competes must be ''reasonable.'' The Commission is concerned a reasonableness standard would foster significant uncertainty among workers and businesses about the enforceability of non-competes, for the same reasons a rebuttable presumption would. In addition, as described in Part II.C.1 of the NPRM, all States where non-competes are enforceable currently apply a reasonableness standard, so a Federal reasonableness standard would not mitigate the negative effects of non-competes that are presently occurring.

The Commission also declines to adopt the alternative of imposing limits on the scope and duration of non-competes. Such a rule would be insufficient to address the negative effects of non-competes on competitive conditions in labor markets or products and services markets. Although a non-compete that lasts for a shorter duration or within a smaller geographic area curtails job mobility for the individual worker it binds to a lesser degree, it nonetheless curtails the worker's job mobility and the ability of competing employers to recruit and access talent. Non-competes limited in duration and scope still tend to inhibit efficient matching between workers and employers, with spillover effects on new business formation and innovation through the mechanisms described in Parts IV.B and IV.C. Furthermore, limitations on the scope and duration of non-competes would not address the spillover effects from non-competes on other workers and consumers. In short, even if a non-compete applies only to a relatively delimited location or time period, it still—by design—cuts off free and fair competition in labor and product and service markets.

In addition, most of the commenters who stated that they were exploited and coerced by non-competes did not do so on the basis that the non-compete was overbroad in scope or duration. Instead, most of the commenters who described the terms of their non-competes described limits on scope and duration that were within the bounds of what is typically permissible under State law.[1018] Some of these commenters even stated expressly that they were subject to the non-compete that was standard or typical in their field. Even these commenters, however, explained how they were exploited and coerced in connection with non-competes because the non-compete was unilaterally imposed and because the non-compete trapped them in worse jobs or forced them to bear significant harms or costs. For these reasons, the Commission declines to adopt bright-line limits on the scope and duration of non-competes.

4. Compensation Requirement

Some commenters requested that the Commission adopt an alternative that would permit non-competes so long as the worker is compensated. Some commenters pointed to Massachusetts and Oregon law governing non-competes under which, for certain workers, non-competes may be enforced if, *inter alia,* they include a minimum level of compensation or consideration to the worker separate from compensation for employment.[1019]

The Commission declines to adopt a rule requiring compensation for non-competes. First, such a rule would not address the harms to competitive conditions that non-competes cause, which result in harm to other workers, to rivals of employers, and to consumers. The Commission finds in Parts IV.B.3.a.ii and IV.C.2.c.ii. that non-competes harm workers other than the workers who sign them, by reducing the number of job opportunities and thereby inhibiting efficient matching for all workers. The Commission further finds in Parts IV.B.3.b and IV.C.2.c.i that non-competes inhibit new business formation and innovation, which affects consumers. Therefore, even if a worker were fully compensated for a non-compete, the fact of that compensation would not redress these negative externalities. Second, this alternative would be ineffective or significantly less effective because of the *in terrorem* effect of non-competes, which the Commission finds to be grounded in empirical evidence and supported by the comment record described in Part IV.B.2.b. Third, such a rule would be difficult to administer and potentially easy to evade, as employers could suppress other wages or job quality while labeling some compensation as attributable to the non-compete.

5. Combination of Different Alternatives

Some commenters suggested the possibility of combining two or more of the alternatives discussed in this Part IX

[1017] *Id.*

[1018] *See* Part IV.B.2.b.

[1019] Mass. Gen. Laws Ann. ch. 149, sec. 24L; Or. Rev. Stat. Ann. sec. 653.295.

in place of a categorical ban. While a combination of these regulations or limitations might modulate some of the ways in which non-competes are exploitative and coercive, they would not be as effective as a comprehensive ban. In particular, a combination approach would lack the clarity of a comprehensive ban and thus would not be as effective as a categorical ban in addressing the exploitation and coercion of workers through non-competes. Moreover, as noted previously, the alternatives discussed would do little to address the tendency of non-competes to negatively affect competitive conditions and to cause spillover effects on other workers and on consumers. Accordingly, a combination of these alternative regulations or limitations would fail to remedy the aggregate and spillover effects of non-competes and thus would not achieve the Commission's stated goals.

C. The No-Action Alternative: Reliance on Existing Legal Frameworks Instead of a Clear National Standard

The Commission sought comment on whether a Federal standard for non-competes would promote certainty for employers and workers.[1020] The Commission finds that a clear national standard for non-competes will more effectively address non-competes' tendency to negatively affect competitive conditions than case-by-case adjudication or relying on existing law alone. The Commission also finds that declining to adopt the final rule, and instead relying on case-by-case adjudication or existing law alone, would not address the exploitation and coercion of workers through non-competes.

1. Comments Received

Many commenters expressed support for the NPRM because they viewed current laws as insufficient to protect all workers, rivals, or consumers, regardless of where they are located, from the negative effects of non-competes on competitive conditions in labor markets and markets for products and services. Numerous workers, businesses, and other commenters said the patchwork of State laws and confusion about those laws, particularly reasonableness tests, makes it difficult for workers and businesses to understand the law and in turn contributes to the use of unenforceable or overbroad non-competes and chills worker mobility. Several commenters also said that case-by-case adjudication and reasonableness tests make it difficult for parties to predict outcomes, which in turn raises litigation costs. Even some organizations opposed to the proposed rule or who supported a different policy believed that a Federal rule could be beneficial, such as to businesses operating in multiple jurisdictions.

In addition, according to commenters, case-by-case adjudication under State law cannot address the harms caused by non-competes through their use in the aggregate. Some commenters also asserted that the patchwork of State laws is complicated by remote and hybrid workers. Others argued that State laws are skewed in favor of employers or leave workers vulnerable to unreasonable agreements. Some argued that many workers, businesses, non-competes, and labor markets cross State lines, demonstrating the need for one standard. Several State Attorneys General also said that numerous complications arise when localities span more than one State and those States have different laws on non-competes; workers become confused and enforcement of non-competes can have spillover effects in another State.[1021]

In contrast, many commenters stated that case-by-case adjudication is preferable to a Federal rule because it allows individual facts to be considered. In addition, many commenters argued that existing State legislative and judicial decisions are sufficient to impose limitations on non-competes while recognizing legitimate business interests. Commenters also argued that States should be allowed to continue their natural experiments with non-competes; that non-competes historically have been and should remain an issue of State law; and that States are best suited to make policy judgments for their citizens.

Some commenters argued that unenforceable or overly broad non-competes are not a problem because courts can strike down or reform them. Some employers asserted that they specifically, or employers more generally, did not enter into unenforceable non-competes. Other commenters argued that employers did not use choice of law clauses to evade State laws, stating the clauses are the products of arms-length bargaining and provide certainty and predictability.

2. Responses to Comments and the Commission's Findings

a. The Value of Rulemaking

The Commission has the authority to make rules and regulations to carry out the FTC Act's prohibition on unfair methods of competition under sections 5 and 6(g) of the FTC Act as described in Parts II.A through II.C, and the Supreme Court has stated that agencies generally have discretion to choose between rulemaking and adjudication.[1022] Based on the empirical evidence, the comments, and the Commission's expertise, the Commission finds that rulemaking is the appropriate method of addressing non-competes.

The prevalence of non-competes across the economy, described in Part I.B.2, and the scale of the harms they cause, described in Parts IV.B and IV.C, show that it is more efficient to address the harms to competition from non-competes via rulemaking compared to case-by-case adjudication. As the D.C. Circuit stated in ruling that the Commission had the authority to promulgate unfair methods of competition rules, ''the availability of substantive rule-making gives any agency an invaluable resource-saving flexibility in carrying out its task of regulating parties subject to its statutory mandate.'' [1023] The Commission estimates that there are 2.92 million firms using non-competes in the U.S.[1024] Adjudicating individual cases against even just one-tenth of 1% of these employers would be slow, inefficient, and costly for the Commission, employers, and workers. Rulemaking provides notice of the application of section 5 to non-competes in a clearer and more accessible way than piecemeal litigation and avoids compliance delays.[1025] The final rule will provide all market participants greater clarity about their obligations under section 5 of the FTC Act, facilitating compliance. Additionally,

Cir. 1973); *see also id.* at 690 (stating that ''the historic case-by-case purely adjudicatory method of elaborating the Section 5 standard and applying it to discrete business practices has not only produced considerable uncertainty'' but has also spawned lengthy litigation).

[1024] *See* Part X.F.6 (estimating that 49.4% of the 5.91 million firms in the U.S. use non-competes).

[1025] *See* Wright & Miller, Federal Practice and Procedure sec. 8117 (2d ed. 2023); *Nat'l Petroleum Refiners,* 482 F.2d at 690 (''[W]hen delay in agency proceedings is minimized by using rules, those violating the statutory standard lose an opportunity to turn litigation into a profitable and lengthy game of postponing the effect of the rule on their current practice. As a result, substantive rules will protect the companies which willingly comply with the law against what amounts to the unfair competition of those who would profit from delayed enforcement as to them.'') (citation omitted).

the final rule will simplify enforcement proceedings by streamlining the proof required.[1026]

In addition, the principal harms from non-competes arise from their tendency to negatively affect competitive conditions in the aggregate. A single non-compete with a single worker may not do much to inhibit efficient matching between workers and employers across a labor market or suppress new business formation or innovation (and what effects it does have would be difficult to measure), but the Commission finds based on empirical evidence that the use of many non-competes across the labor market does have these aggregate net negative effects.[1027] For this reason, rulemaking is preferable to individual litigation for addressing the negative effects of non-competes. Past Commission experience has also illustrated that case-by-case enforcement, education, and other enforcement mechanisms are not always sufficient to stop widespread harms.[1028] A Federal rulemaking is the most efficient method to address the scale of harm to competitive conditions in labor, product, and service markets caused by non-competes.

Finally, ''utilizing rule-making procedures opens up the process of agency policy innovation to a broad range of criticism, advice and data that is ordinarily less likely to be forthcoming in adjudication.'' [1029] Rulemaking is particularly beneficial when, as here, ''a vast amount of data had to be compiled and analyzed, and the Commission, armed with these data, had to weigh the conflicting policies.'' [1030] Rulemaking also allows for more fulsome engagement from the public by providing for public comment on a complete regulatory scheme. The Commission greatly benefited from the submitted comments.

[1026] *See Nat'l Petroleum Refiners,* 482 F.2d at 690 (''With the issues in Section 5 proceedings reduced by the existence of a rule delineating what is a violation of the statute or what presumptions the Commission proposes to rely upon, proceedings will be speeded up.'').

b. Case-by-Case Litigation Alone Cannot Address the Negative Effects of Non-Competes on Competition

The Commission finds that case-by-case litigation alone is insufficient to address the harms to competition from non-competes due to the cost of litigation, which deters many workers from challenging non-competes, and the limited resources of public enforcement agencies. In addition, individual litigation is not well-suited to redress the negative externalities non-competes impose on other workers, other employers, consumers, and the economy from their use in the aggregate.

Many commenters addressed the shortcomings of individual litigation as a means for addressing the harms of non-competes. Numerous commenters noted that litigation is costly and many workers cannot afford to litigate their non-competes.[1031] Many commenters, including workers, entrepreneurs, and employment attorneys, shared examples of five-figure and six-figure litigation costs related to non-compete lawsuits. Numerous commenters reported that the fear of litigation costs induced them to refrain from seeking or accepting other work or starting a business, even though they thought the non-compete was likely unenforceable. Many other commenters stated that they complied with a non-compete after they were threatened with enforcement, even though they were unsure about the non-compete's enforceability. One study finds that 53% of workers subject to non-competes are hourly workers,[1032] who are particularly unlikely to be able to afford a court challenge.

Commenters also noted some non-competes include liquidated damages clauses or fee-shifting provisions requiring the worker to pay the employer's attorney and other costs if the employer wins, further increasing the costs (and risks) of challenging a non-compete. In addition, commenters stated that litigation is time-consuming and could take as long or longer than the non-compete period. For example, one commenter shared a decision in the commenter's own case where the appellate court found the non-compete violated public policy by leaving an area with only one surgeon in a specialty—but reached that decision only after the two-year non-compete had already run its course.[1033] Commenters also said workers who sued their employer could experience reputational harm and difficulty finding work going forward.

Litigation can be even riskier if a court might reform a non-compete, which leaves the worker subject to some restrictions even if the initial non-compete was impermissibly broad. Several commenters cited a *Harvard Law Review* article that discusses the consequences of allowing courts to sever or reform overbroad non-competes:

> For every covenant that finds its way to court, there are thousands which exercise an *in terrorem* effect on employees who respect their contractual obligations and on competitors who fear legal complications if they employ a covenantor, or who are anxious to maintain gentlemanly relations with their competitors. Thus, the mobility of untold numbers of employees is restricted by the intimidation of restrictions whose severity no court would sanction. If severance is generally applied, employers can fashion truly ominous covenants with confidence that they will be pared down and enforced when the facts of a particular case are not unreasonable.[1034]

If there is no penalty for drafting overbroad non-competes (as is true in most States),[1035] employers have little incentive to draft non-competes narrowly, particularly if a court is likely to revise it rather than strike it down, or if a worker is unlikely to be able to litigate at all. An employment attorney commented it is particularly difficult to advise workers about whether their specific non-compete is enforceable when it is possible a court may modify the underlying non-compete.

Case-by-case litigation under other antitrust laws alone is also insufficient to address the harms from non-competes. Non-competes restrain trade and therefore are subject to the Sherman Act.[1036] While private litigants may bring private causes of action to enforce the Sherman Act,[1037] the Commission views private litigation under the Sherman Act as an ineffectual response in the context of non-competes based on the history of cases by private litigants arising under that Act, as explained in the NPRM.[1038] For an individual litigant, proving harm to competition in the relevant geographic and product markets is a resource-intensive task that

[1031] *See also* Part IV.B.2.b.ii (describing exploitative and coercive effects of the risk and cost of being subject to a non-compete suit).

[1036] *See* Part I.B.1.

[1037] *See* 15 U.S.C. 15.

[1038] NPRM at 3496.

typically requires expert testimony.[1039] This makes an already expensive proposition even less palatable for most workers and further tips the risk-versus-reward calculus away from litigation. In addition, to succeed on a Sherman Act claim, a plaintiff must show harm to competition as a whole, not just to themselves. It may be difficult or impossible for a worker to establish that their individual non-compete—or a single firm's use of a non-compete—adversely affected competition in a labor market or product/service market sufficiently to violate the Sherman Act.[1040] Section 5, on the other hand, is more inclusive than the Sherman Act.[1041] As outlined in Part II.F, section 5 requires a showing of indicia of unfairness and a tendency to negatively affect competitive conditions. It does not require a separate showing of market power or market definition—nor does it require proof of harm to competition by each non-compete.[1042]

Case-by-case litigation by public enforcers, such as the Commission or State attorneys general, is a potential alternative or supplement to private litigation under other antitrust laws. But the ability of public enforcers to engage in effective case-by-case litigation related to non-competes, absent a rule, is limited.

As cited in Parts I.B. and II.C.2, the FTC has previously secured consent orders premised on the use of non-competes being an unfair method of competition under section 5, and the Commission has the authority to determine that non-competes are unfair methods of competition through adjudication. However, FTC resource constraints limit the potential effectiveness of enforcement of section 5 on a purely case-by-case basis. The Commission is an independent agency that works to promote fair and open markets and protect the entire American public from unfair and deceptive business practices. The Commission has fewer than 1,500 employees for its entire body of work related to this mission,[1043] which includes investigating, challenging, and litigating anticompetitive mergers and conduct; processing and reviewing merger filings; and investigating and challenging a wide range of consumer protection issues.[1044]

Similarly, several State Attorneys General commented that the multi-factor common law approaches to non-compete law result in piecemeal decisions that do not address the non-compete problem in a uniform manner.[1045] These State Attorneys General also noted that some State enforcement agencies lack straightforward authority to enforce existing common law protections related to non-competes and argued that the challenges associated with common law enforcement underscore the need for a Federal rule.[1046] And the resource limitations to pursue non-competes comprehensively through enforcement limit States equally—if not more.

The Commission estimates that there are approximately 30 million individual non-competes in the U.S.[1047] In contrast to the large volume of non-competes, the resources of public enforcement agencies are limited. Public enforcers must balance competing demands for resources and priorities when they bring public enforcement actions. Public enforcers cannot conceivably investigate the specific details of every non-compete or initiate litigation concerning more than a small fraction of unlawful non-competes. A Federal rule provides clarity to market participants, engages all stakeholders in the development of the rule, and more effectively ceases an unfair method of competition.

The significant limitations on the ability of private and public litigants to challenge unlawful non-competes have practical implications. Courts cannot strike down an unenforceable non-compete that they never had the opportunity to review. Moreover, as detailed in Part IV.B.2.b, non-compete restrictions may still have significant *in terrorem* effects when workers are uncertain about the enforceability of their non-competes or lack the ability to challenge their use.

Furthermore, case-by-case litigation is insufficient to address negative externalities from non-competes (*i.e.,* harms non-competes cause to persons other than the parties to the non-compete). As described in Parts IV.B and IV.C, non-competes impose significant negative externalities on other workers, other firms, consumers, and the economy. Individual non-compete cases are not well-suited for redressing these harms. For example, while the precise reasonability test for non-competes differs from State to State, the test typically considers the business interest asserted by the employer; the harm to the worker; and the injury to the public from the loss of the worker's services.[1048] This test does not generally account for the harms experienced by other workers, other firms, consumers, and the economy resulting from the negative effects of non-competes on competition.

Furthermore, because the significant harms of non-competes result from their aggregate use, they are unlikely to be captured by an assessment of an individual worker's non-compete or an individual firm's use of non-competes. This is true regardless of whether those non-competes are challenged under State non-compete laws or under other antitrust laws. It is likewise true regardless of whether non-competes are challenged by private litigants or public enforcers. Accordingly, the Commission finds that case-by-case litigation alone is insufficient to address the negative externalities of non-competes.

The Commission, by contrast, is well-positioned to evaluate non-competes holistically. The Commission is an expert agency and has used its expertise to assess the weight of the empirical evidence and comment record to evaluate the aggregate effects of non-competes. The Commission here implements a clear national standard through notice-and-comment rulemaking to protect competition, based on the evidence that the use of non-competes in the aggregate negatively affects competition and harms workers and consumers.

For all these reasons, the Commission finds that case-by-case litigation is not a viable alternative to the final rule.[1049]

[1039] *See, e.g., U.S. Healthcare, Inc.* v. *Healthsource, Inc.,* 986 F.2d 589, 599 (1st Cir. 1993) (''In practice, the frustrating but routine question how to define the product market is answered in antitrust cases by asking expert economists to testify.'').

[1040] *See* NPRM at 3496–97 (discussing non-compete cases that have been brought under the antitrust laws).

[1047] *See* Part I.B.2.

[1048] *See* NPRM at 3494–95.

[1049] A few commenters suggested that the Commission could create guidelines instead of a rule to explain what factors the agency would look at in an enforcement action. By definition, however, a guidance document would ''not have the force and effect of law.'' *Perez* v. *Mortg. Bankers Ass'n,* 575 U.S. 92, 97 (2015) (quoting *Shalala* v. *Guernsey Mem'l Hosp.,* 514 U.S. 87, 99 (1995)). Guidelines would not bind employers or courts and would not provide workers with the same clarity about the enforceability of their non-competes. Moreover, case-by-case litigation itself is not suited to address the negative externalities of non-competes, a concern the issuance of guidelines would not address. The Commission finds that the issuance of guidelines is not a viable alternative to the final rule for the same reasons that it finds that the no-action alternative generally is not a viable alternative to the final rule.

c. State Law Alone Cannot Address the Negative Effects of Non-Competes on Competition

The Commission appreciates that States have enacted legislation in recent years to ban or restrict non-competes and ameliorate their negative effects.[1050] The Commission has long recognized the value of concurrent enforcement of Federal and State law and believes States have an important role to play in restricting the use of non-competes. Indeed, in this final rule, the Commission has revised § 910.4 to ensure that States may continue to enforce laws that restrict non-competes and do not conflict with the final rule. However, the Commission believes that reliance on State law alone is insufficient to address the negative effects of non-competes on competition. The practical ability of States to address the harms to their residents from non-competes is limited by various factors, including employers' use of choice-of-law, forum-selection, and arbitration clauses; significant confusion among both employers and workers resulting from the patchwork of State law, which chills workers from engaging in competitive activity even where non-competes are likely unenforceable under State law and also increases employers' compliance costs, particularly given the increase in interstate remote work; spillover effects from other States' laws; and incentives for States to adopt permissive non-compete policies.

Many States have adopted statutory restrictions or compete bans on non-competes. Four States—California, Minnesota, North Dakota, and Oklahoma—have adopted statutes rendering non-competes void for nearly all workers.[1051] The majority of the remaining 46 States have statutory provisions or case law that ban or limit the enforceability of non-competes for workers in certain specified occupations.[1052] The general language of the test for whether a non-compete is reasonable is fairly consistent from State to State.[1053] However, the specifics of the application of the standard differ from State to State. For example, States vary in how narrowly or broadly they define legitimate business interests and the extent to which courts are permitted to modify an unenforceable non-compete. States also differ with respect to statutory restrictions on non-competes.[1054] As a result, among the 46 States where non-competes may be enforced, variation exists with respect to the enforceability of non-competes.[1055]

State law also differs with respect to the steps courts take when they conclude that a non-compete is unenforceable as drafted. As noted in the NPRM, the majority of States have adopted the ''reformation'' or ''equitable reform'' doctrines, which allow courts to revise the text of an unenforceable non-compete to make it enforceable.[1056]

Because the enforceability of non-competes and courts' positions with respect to unenforceable non-competes vary from State to State, the question of which State's law applies in a legal dispute can determine the outcome of a non-compete case. Non-competes often contain choice-of-law provisions designating a particular State's law for resolution of any future dispute.[1057] Furthermore, some non-competes include forum-selection provisions specifying the court and location where a dispute may be heard.[1058] The default rule under conflict-of-laws principles is that the court honors the parties' choice of law, meaning that the burden is typically on the worker—the vast majority of whom the Commission finds are exploited and coerced when entering into a non-compete—to negotiate for the law of a different forum to apply.[1059]

There is significant variation, however, in how courts apply choice of law rules in disputes over non-competes.[1060] As a result, it can be difficult for employers and workers to predict how disputes over choice of law (and, in turn, the enforceability of the non-compete) will be resolved.[1061] Several commenters agreed that a Federal rule would alleviate these problems.

Choice of law provisions may also mean that workers lose their own State's protections. For example, workers from States where non-competes are banned commented that they faced enforcement of non-competes that selected the law of another State. This raises the concern that choice of law clauses can be used to evade State bans or restrictions by forum shopping.[1062] As two scholars note, when ''the parties or issues involved have connections to multiple jurisdictions,'' the law ''confounds lawyers and commentators because of its complexity and unpredictability.'' [1063]

Employers may also impose arbitration clauses, which require that legal disputes with the employer—including disputes related to non-competes—be resolved through binding arbitration rather than in court.[1064] Where such clauses are valid, the Federal Arbitration Act requires that courts enforce them.[1065] Choice of law, forum selection, and arbitration clauses create opportunities for employers to forum-shop in ways that undermine any given State's ability to effectively regulate non-competes.

Numerous workers, businesses, and other commenters said the patchwork of State laws and confusion about those laws makes it difficult for workers and businesses to understand whether a particular non-compete would be enforceable. The lack of a clear national standard, and resulting confusion,

[1050] *See* NPRM at 3494 (summarizing recent State non-compete legislation).

contributes to non-competes being used in jurisdictions where they are unenforceable. Starr, Prescott, and Bishara find that employers frequently use non-competes even when they are unenforceable under State law.[1066] Similarly, Colvin and Shierholz find that 45.1% of workplaces in California use non-competes even though they are unenforceable there.[1067] Anecdotally, an economist commented that the Commission's *Prudential Security* case, in which the employer continued using non-competes after they were held unenforceable by a court, was an example of employers enforcing unenforceable non-competes.[1068]

While the Commission has no doubt that many employers aim to ensure their contracts comply with applicable law, the empirical evidence indicates that at least some employers are using unenforceable non-competes, and some workers are turning down jobs where their non-competes are likely unenforceable. Some commenters referenced Starr, Prescott, and Bishara's finding that workers frequently cite non-competes as a factor in turning down job offers in both States that enforce non-competes and in those that do not.[1069] The study also finds that workers are more likely to report that they would be willing to leave for a competitor when they did not believe their employer would attempt to enforce a non-compete in court.[1070] The study suggests that whether a worker's non-compete is enforceable may matter less than whether the employer is willing to try to enforce it.[1071] The Commission notes that this study does not necessarily indicate a causal relationship, but it does indicate that for many workers, the *in terrorem* effect of non-competes may outweigh any State protections.

Furthermore, the ability of States to address harms to their residents from non-competes is limited by spillover effects from other States. The economies of States are closely interconnected. Therefore, even where a State adopts a law that strictly regulates non-competes, such a law can be undermined by permissive non-compete laws in a nearby State.[1072]

Finally, several comments argued that State regulation of non-competes should continue by quoting Justice Brandeis's dissent in *New State Ice Co.* v. *Leibmann:* ''[i]t is one of the happy incidents of the [F]ederal system that a single courageous State may, if its citizens choose, serve as a laboratory; and try novel social and economic experiments without risk to the rest of the country.'' [1073] The Commission disagrees that further laboratory testing by States is needed. States have been experimenting with non-compete regulation for more than a century, with laws ranging from full bans to notice requirements, compensation thresholds, bans for specific professions, reasonableness tests, and more.[1074] Past State experimentation and legal changes yielded a considerable body of empirical research, which as described in Parts IV.B and IV.C, demonstrates that non-competes negatively affect competitive conditions in labor markets and in product and service markets. This evidence supports the Commission's finding that non-competes are an unfair method of competition.

Individual States' non-compete policies can cause spillover effects that negatively affect competitive conditions in other States. Individual States' non-compete policies can also affect the operation of legal regimes in other States. Choice of law provisions cause confusion for workers even in States where non-competes are unenforceable. There are incentives for some States to adopt extremely permissive non-compete policies to attract employers that favor non-competes, and potentially even to enable employers to ''export'' those permissive policies to other States through choice-of-law provisions.[1075] In short, States are interconnected with respect to non-competes. Without a uniform standard through the final rule, States are forced to balance the benefit to their residents of laws regulating non-competes against the fear that some employers may shift jobs to States where non-competes are more enforceable. One benefit of the Commission's rulemaking is it resolves this problem. The rulemaking record shows banning non-competes will improve competitive conditions in all States and will benefit workers in all States.

X. Regulatory Analysis

A. Introduction

The Commission has examined the economic impacts of the final rule as required by section 22 of the FTC Act (15 U.S.C. 57b–3). Section 22 directs the Commission to issue a final regulatory analysis that analyzes the projected benefits and any adverse economic effects and any other effects of the final rule. The final regulatory analysis must also summarize and assess any significant issues raised by comments submitted during the public comment period in response to the preliminary regulatory analysis.[1076]

B. Preliminary Analysis

Pursuant to section 22 of the FTC Act, the Commission issued a preliminary regulatory analysis of its proposed rule.[1077] The preliminary regulatory analysis contained (1) a concise description of the need for, and objectives of, the proposed rule; (2) a description of any reasonable alternatives to the proposed rule that may accomplish the stated objective of the final rule in a manner consistent with applicable law; and (3) for the proposed rule and for each of the alternatives described, a preliminary analysis of the projected benefits and any adverse economic effects and any other effects.[1078]

In the preliminary regulatory analysis, the Commission described the anticipated effects of the proposed rule and quantified the benefits and costs to the extent possible. For each benefit or cost quantified, the analysis identified the data sources relied upon and, where relevant, the quantitative assumptions made. The preliminary analysis measured the benefits and costs of the proposed rule against a baseline in which the Commission did not promulgate a rule regarding non-competes and included in the scope of the analysis the broadest set of economic actors possible. Several of the benefits and costs were quantifiable, but not monetizable—especially with respect to differentiating between transfers, benefits, and costs. The Commission preliminarily found that others were not quantifiable. The

preliminary analysis discussed any bases for uncertainty in the estimates.

The Commission preliminarily found substantial positive effects of the proposed rule: an increase in workers' earnings by $250–$296 billion annually (with some portion representing an economic transfer from firms to workers); an increase in new firm formation and competition; a reduction in health care prices (and prices in other markets may also fall); and an increase in innovation. The Commission noted that several of these benefits overlap (*e.g.,* increases in competition may fully or in part drive decreases in prices and increases in innovation). The Commission also preliminarily found some costs of the proposed rule. Direct compliance and contract updating would result in $1.02 to $1.77 billion in one-time costs, and firm investment in human capital and capital assets would fall.

The Commission preliminarily concluded that the substantial labor market and product and service market benefits of the proposed rule would exceed the costs. Furthermore, the Commission preliminarily found the benefits would persist over a substantially longer time horizon than most costs of compliance and contract updating.

C. Public Comments on the Preliminary Regulatory Impact Analysis

Based on the comments received, the final regulatory analysis reflects greater quantification where possible and includes sensitivity analyses to reflect different assumptions, including assumptions commenters suggested. The final regulatory analysis concludes, consistent with the preliminary analysis, that the benefits of the final rule justify the costs.

Some commenters urged the Commission to quantify the costs and benefits to a greater degree. In the final analysis, the Commission incorporates greater quantification where possible. That some effects cannot be quantified or monetized does not, however, undermine the Commission's conclusion that the benefits justify the costs.

Some commenters focused on the methodology used to estimate earnings effects in the preliminary analysis, stating that extrapolating estimated effects on earnings based on linear predictions may result in incorrect estimates. These commenters stated that linear predictions might be particularly unreliable outside the range observed in the data. While as a general matter, linear extrapolation may not be appropriate in all circumstances, especially in the absence of data supporting such an approach, the Commission notes the linear effect of non-compete enforceability on earnings was statistically tested in the economic literature.[1079]

Nevertheless, to test and confirm the robustness of the conclusions drawn in the preliminary analysis from the linear approach, in this final analysis, the Commission uses several estimation approaches. For its primary analysis, the Commission adopts an approach that does not rely on extrapolation. Specifically, the Commission assumes that the historical average change [1080] in non-compete enforceability observed at the State level represents the total change in enforceability that results from the rule. This approach is hereafter referred to as the ''average enforceability change approach.'' It likely underestimates the effects of the rule because the State-level changes that would occur under the rule (which adopts a near comprehensive ban) would be substantially larger than the changes observed historically. The Commission also conducted sensitivity analyses with two other approaches—described further in Parts X.C and X.F.6.a—that use linear extrapolation to scale up the effects estimated in the literature to estimate the effects of the final rule (*i.e.,* a near comprehensive ban).

Some commenters alleged the proposed rule would increase inflation. Some commenters also stated the proposed rule would harm shareholders by decreasing corporate profits. In response, the Commission notes that the regulatory analysis attempts to quantify and monetize real costs and benefits of the final rule as opposed to nominal costs and benefits. Therefore, net benefits are benefits that represent increased economic efficiency resulting from the final rule rather than increases in the dollar value of output that may be due to inflation. Additionally, earnings increases are due, at least in part, to increased economic efficiency, which would likely lower prices. Accordingly, the Commission does not expect that prices will rise because of the rule. Indeed, empirical evidence shows that in physician clinics, prices fall with decreased non-compete enforceability.[1081] Similarly, while the effect of the final rule on corporate profits is unclear,[1082] the Commission's analysis is focused on overall gains or losses in economic surplus—*i.e.,* the net benefits to society, not to individual corporations.

Some commenters stated that certain costs may be missing from the preliminary analysis, including costs related to worker misconduct and litigation over the validity of the final rule. The Commission finds no evidence or compelling arguments directly linking non-competes to worker misconduct and therefore does not consider such costs.[1083] Costs related to litigation over the validity of the rule are outside the scope of the regulatory analysis under section 22, which is concerned with costs and benefits should the final rule be implemented.

Some commenters stated the rule may have beneficial tax ramifications for businesses and workers with non-competes that are no longer enforceable, including based on changes in amortization schedules. In response, the Commission notes that any tax savings under the final rule represent transfers from the government to firms that previously used non-competes. Significantly, the Commission is allowing existing non-competes with senior executives, who may be most likely to have non-competes with tax implications, to remain in effect. This will mitigate the need for tax-related administrative work. In response to comments on the tax ramifications of clawed back pay, the final rule does not encourage or require firms to ''claw back'' compensation and given the exclusion for senior executives' existing non-competes in the final rule, situations in which a firm would be in a position to consider clawing back pay are likely to be extremely limited, if any.

Some commenters stated workers may be harmed if firms claw back workers' earnings, if workers lose long-term incentive payments, retention bonuses, and severance payments, or if workers must pay for training out of pocket in response to the rule. First, in Parts IV.B.3.a.iiv and X.F.6.a, the Commission finds earnings increases overall associated with decreases in non-compete enforceability. With respect to existing non-competes, non-competes

[1079] Johnson, Lavetti, & Lipsitz, *supra* note 388 at 17.

[1080] In other words, taking all changes in non-compete enforceability between 1991 and 2014 (the range studied in the relevant literature) into account, the Commission considers a change whose magnitude is equal to the average of the magnitudes of all those changes. *See* Johnson, Lavetti, & Lipsitz, *supra* note 388 for more details.

[1081] Hausman & Lavetti, *supra* note 590.

[1082] The evidence in the empirical literature is mixed. Younge & Marx (*supra* note 755) find an increase in firm value when non-competes became enforceable in Michigan. Hiraiwa, Lipsitz, & Starr (*supra* note 502) find no effect on firm value when non-competes were prohibited for the majority of workers in Washington.

[1083] *See* Part V.D.3.

with senior executives, which are most likely to be structured with incentive payments, bonuses, and severance, may remain in effect under the final rule. To the extent any other existing non-competes with such structures are not excluded from the final rule, as noted in Parts III.D and IV.D, deferred compensation and other structured payments generally have many material contingencies other than a non-compete, which means incentive payments and retention bonuses will continue to retain value for the employer. Going forward, under the final rule, agreements for deferred compensation and other structured payments may be permissible as long as they do not fall within the definition of non-compete clause in § 910.1. With respect to payments for training, the Commission notes evidence that worker-sponsored training is unaffected by legal enforceability of non-competes,[1084] and it is therefore unlikely that workers will incur costs related to training as a result of the final rule.

Some commenters disagreed with the Commission's use of patenting activity as a proxy for innovation in the preliminary analysis, stating that the value of innovation may not be captured in patenting, in part because employers may use patents as a substitute for non-competes. First, the Commission agrees that innovation likely has value above and beyond patenting. That patenting does not capture the full value of innovation is not a basis for dismissing its value as a proxy altogether. Second, while it is theoretically possible firms may substitute from the use of non-competes to the use of patents to protect intellectual property, the empirical literature shows increases in innovation do not follow from the simple substitution of protections between non-competes and patents. Specifically, the empirical literature confirms the innovations prompted by decreased non-compete enforceability are qualitatively valuable, and—examining the relationship between non-compete enforceability and patenting for drugs and medical devices, where patenting is ubiquitous [1085]—it shows the patents reflect true net increases in innovation (as opposed to substitutions). One commenter stated there can be difficulty ascertaining the value of patenting. The Commission finds that there are several estimates of the private value of a patent (*e.g.,* the value to the patenting firm) in the literature, but no estimates of the social value of a patent, as further discussed in Part X.F.6.b. The Commission therefore stops short of monetizing this benefit. The final analysis addresses effects on innovation in greater detail in Part X.F.6.b.

Some commenters asserted the research related to investment in human capital does not distinguish between two different types of training: core training, *i.e.,* training required to perform job duties, and advanced training, *i.e.,* training with potential to increase productivity beyond the baseline requirements for job performance.[1086] Commenters stated that when non-competes are more enforceable, workers may receive additional core training rather than advanced training. In other words, when non-competes are more enforceable, labor mobility decreases and workers may also move to new industries to avoid potentially triggering non-compete clause violations (as discussed in Part IV.B.3.b.ii), both of which make experienced workers less often available for hire. Firms therefore may need to train workers at a greater rate because they will hire inexperienced workers who require more core training. Research finding increases in training associated with increases in non-compete enforceability therefore may not imply increases in advanced training—*i.e.,* the kind of training that increases productivity of workers already able to perform job duties, with net benefits for society as a whole. In response, the Commission agrees that decreases in training under the final rule may represent decreases in core, rather than advanced, training. It is not possible to discern whether the observed effects on training in the literature represent core versus advanced training because evidence that would facilitate such an analysis does not exist. Importantly, a decrease in core training would be economically beneficial because it would reflect a more efficient use of the labor force. Therefore, to the extent a decrease in training reflects a change in core training, this would be a net benefit of the final rule—not a cost. On the other hand, to the extent a decrease in training is due to a change in advanced training, this would represent a net cost of the final rule. The Commission further discusses investment in human capital in Part X.F.7.a.

Some commenters stated that costs associated with rescinding existing non-competes and updating contractual practices may be greater than estimated in the NPRM and attributed the greater cost to the need for high-cost outside counsel. In response, the Commission finds it likely that many firms will not need to use costly outside counsel (or indeed, any counsel) to comply with the final rule. This is especially true since the final rule allows non-competes for senior executives to remain in effect, since it does not require rescission of any existing contracts, and since it provides a model safe harbor notice for other workers and makes other adjustments to simplify the notice process. In response to commenters stating that firms will need more time to implement than estimated in the NPRM, the Commission conducts an updated analysis in Part X.F.7.b. The Commission notes that the model language provided in the final rule and allowing employers to use the last known address, mail or electronic, will significantly simplify the notice process for employers. Additionally, the Commission performs two sensitivity analyses in Part X.F.7.b. The first assumes an attorney's time is more costly—it replaces the primary estimate of the average hourly productivity of an attorney ($134.62 per hour, based on BLS earnings data) with an estimated rate of the cost of outside counsel who is a tenth-year attorney ($483 per hour).[1087] The second makes different assumptions about the time spent by employers related to existing non-competes that will be no longer be enforceable and updating contractual practices. Finally, the Commission clarifies the definition of ''non-compete clause'' in Part III.D to reduce confusion and give employers and workers a clearer understanding of what is prohibited. This, in turn, will reduce compliance costs and potential litigation costs over what constitutes a non-compete.

One commenter from the retail industry claimed the cost of implementing the proposed rule could

[1084] Starr, *supra* note 445.

[1085] See Part IV.B.3.b.ii, discussing Johnson, Lipsitz, & Pei, *supra* note 526.

[1086] Commenters used the words ''requisite'' and ''discretionary'' in lieu of ''core'' and ''advanced,'' respectively.

[1087] This estimate is drawn from the Fitzpatrick Matrix, which is a fee schedule used by many U.S. courts for determining the reasonable hourly rates in the District of Columbia for attorneys' fee awards under Federal fee-shifting statutes. It is used here as a proxy for market rates for litigation counsel in the Washington, DC area, which likely represent the high end of rates for litigation counsel in the U.S. The estimate is therefore adjusted to reflect a national rate by multiplying by the ratio of the hourly wage of attorneys nationwide to the hourly wage of attorneys in the Washington, DC metro area, based on BLS Occupational Employment and Wage Statistics data. The Commission conservatively uses the rates of a tenth-year attorney—a much more experienced attorney than is likely to be needed (and indeed no attorney at all may be needed). *See* Fitzpatrick Matrix, *https://www.justice.gov/usao-dc/page/file/1504361/dl?inline. See* BLS Occupational Employment and Wage Statistics, *https://www.bls.gov/oes/data.htm.*

be $100,000 to $200,000 per firm but did not support this assertion with any evidence. The Commission disagrees with this assertion, which does not align with its careful estimates based on empirical evidence and significant expertise presented in Part X.F.7.b.ii. The Commission's estimates also acknowledge and account for potentially heterogeneous costs across firms.

Some commenters stated that employers would need to spend substantial resources to litigate trade secret disputes and violations of post-employment restrictions other than non-competes. One commenter stated that the cost of a trade secret case may range from $550,000 to $7.4 million, depending on the monetary value of the trade secret claim. The Commission analyzes costs of litigation in Part X.F.7.c. The Commission agrees with commenters that trade secret litigation, and litigation over post-employment restrictions other than non-competes, may be costly. However, the Commission notes that no evidence exists to support the hypothesis that litigation on these fronts will increase because of the final rule. Indeed, recent evidence suggests that trade secret litigation does not increase following bans on non-competes.[1088] Moreover, the final rule, with its clear and bright-line standard (as compared to the current patchwork of State laws), would likely decrease litigation attempting to enforce non-competes, including litigation initiated by former employers against workers who start their own business or who find a new employer. While the Commission does not have evidence on the frequency of these different types of litigation, it expects the decrease in non-compete litigation would likely offset potential increases in other litigation.

Positing that firms will be reluctant to share trade secrets with workers under the rule, some commenters also stated that the costs of lessened sharing of trade secrets should be taken into account. Since no data exists on the effect of non-competes on the monetary value of shared trade secrets, the Commission does not quantify or monetize this effect. Moreover, there is no evidence that employers will lessen the extent to which they share trade secrets under the final rule, much less that any change would be material. As detailed in Part IV.D, employers have less restrictive alternatives to non-competes that mitigate these concerns.

Some commenters reference the Starr, Balasubramanian, and Sakakibara study [1089] and the Commission's interpretation of it in the NPRM to assert that firms founded because of the rule may be of lower quality than existing firms in terms of average employment and survival rates, and adjustments should be made to the Commission's analysis to account for these differences. Upon further review, the Commission interprets the authors' findings to show that within-industry spinouts resulting from lessened non-compete enforceability tend to be lower quality than non-within industry spinouts resulting from lessened non-compete enforceability. However, both types of spinouts are better, on average, than spinouts that form under stricter non-compete enforceability. The study's results therefore suggest that, if anything, the Commission underestimates the final rule's benefits from new business formation, because the estimates do not adjust for quality.

Some commenters asserted that, because of the positive effects of the proposed rule on labor mobility, firms may face greater costs associated with turnover (especially firms that currently use non-competes) due to the cost of finding a replacement, the cost of training a replacement, and the cost of lost productivity. Based on Pivateau (2011),[1090] one commenter estimated that turnover costs 25% of the annual salary of a worker. Some commenters also argued that some firms may face decreased costs of turnover, because more plentiful availability of labor can reduce the cost of hiring. The Commission finds that there may be distributional effects of increased turnover—benefits for firms that face a lower cost of hiring and costs for firms losing workers who had been bound by non-competes—and assesses the same in Part X.F.9.c.

Some commenters offered additional empirical evidence not discussed in the NPRM that was not specific to the proposed regulatory analysis. The Commission responds to those comments in Part IV.

D. Summary of Changes to the Regulatory Analysis

In the final regulatory analysis presented in Part X.F, the Commission updates its analyses based on the parameters of the final rule, comments received, supporting empirical evidence raised by commenters, changes in the status quo regarding regulation of non-competes, and reanalysis of evidence presented in the NPRM.[1091] This includes the Commission's attempt to quantify and monetize, to the extent feasible, all costs and benefits of the final rule, as well as transfers and distributional effects. The Commission additionally analyzes hypothetical scenarios to assess what otherwise unmonetized benefits and costs would lead to a final rule that is net beneficial. Finally, the Commission elects to include an analysis of an alternative the Commission considered, namely an analysis of fully excluding senior executives.[1092]

Under the final rule, existing non-competes with senior executives may remain in effect. While this change likely affects some costs and benefits associated with the final rule temporarily, the Commission does not specifically quantify or monetize those effects. The effect on persistent costs and benefits would be temporary, as senior executives will eventually move out of their jobs and retire or move into new jobs, to which the final rule will apply. The Commission notes throughout its analysis, however, how different estimates may be affected by this differential treatment of senior executives even if it cannot quantify the precise effect.

E. Summary of Benefits and Costs

The Commission considered several effects of the final rule on economic outcomes: earnings, innovation, entrepreneurship, distributional effects on workers, investment in human capital, capital investment, legal and administrative costs, prices, labor mobility and turnover, and litigation costs.

The Commission describes the primary estimates of benefits, transfers, costs, and distributional effects associated with each of these outcomes in Table 1. Table 1 also reports whether the outcome for each effect is quantifiable or monetizable and

[1088] Greenwood, Kobayashi & Starr, *supra* note 757. The Commission notes that this study supplements—but is not necessary to support—its finding that no evidence supports the conclusion that litigation costs will increase under the final rule. That finding is based on the Commission's expertise and the rulemaking record, including relevant comments. This study was published after the close of the comment period.

[1089] Starr, Balasubramanian, & Sakakibara, *supra* note 518.

[1090] Griffin Toronjo Pivateau, *Preserving Human Capital: Using the Noncompete Agreement to Achieve Competitive Advantage,* 4 J. Bus. Entrepreneurship & L. 319 (2010).

[1091] As described in detail in this Part X, the Commission's final analysis, including its quantification and monetization of effects, therefore is not precisely the same as its preliminary analysis.

[1092] The Commission is not required to analyze costs and benefits of regulatory alternatives in its final regulatory analysis. *See* 15 U.S.C. 57b–3(b)(2)(B).

discusses important nuance or uncertainty.

TABLE 1

Category	Extent of characterization	Description of estimate	Discussion
Earnings	Quantified	The estimated ten-year present discounted value of increased worker earnings is $400-$488 billion. Effect on earnings partially represents a transfer and partially represents a benefit of the final rule.	The extent to which the estimated increase in worker earnings represents a benefit versus a transfer is unclear, though there is evidence to suggest that a substantial portion is a benefit.
Innovation	Quantified	Annual count of new patents estimated to rise by 3,111–5,337 in the first year, rising to 31,110–53,372 in the tenth year. Annual spending on R&D estimated to fall by $0-$47 billion. Effect on innovation represents a benefit of the final rule.	Estimates of the societal value of innovation are not available. The two effects on innovation together represent a benefit because more output (amount of innovation) is produced with less input (R&D spending).
Prices	Partially Quantified	The estimated ten-year present discounted value of decreases in spending on physician and clinical services is $74-$194 billion. Prices in other sectors may decrease as well but are not quantified. The effect on prices partially represents a transfer and partially represents a benefit of the final rule.	Price changes encompass transfers (from firms to consumers) and benefits (since price changes are likely due to increased competition); however, the exact split is not clear. Increased competition may also increase consumer quantity, choice, and quality. Prices outside of physician and clinical services may fall due to changes in competition because of new entrants; however, the literature has not quantified this effect.
Investment in Human Capital	Monetized	The estimated ten-year present discounted value of the net effect of the final rule on investment in human capital ranges from a benefit of $32 billion to a cost of $41 billion. The effect on investment in human capital may represent a cost or benefit of the final rule.	The range in estimates reflects uncertainty over whether decreased investment in human capital under the final rule reflects reductions in advanced investment (which the firms opt into to increase productivity) or core investment (which is no longer necessary if more experienced workers are hired) and uncertainty over the workers for whom investment in human capital (all workers or workers in occupations which use non-competes at a high rate) is affected.
Legal and Administrative Costs	Monetized	One-time legal and administrative costs are estimated to total $2.1–$3.7 billion. Legal and administrative costs represent a cost of the final rule.	
Litigation Effects	Not quantified or monetized	The final rule may increase or decrease litigation costs. Effects on litigation costs may represent a cost or benefit of the final rule.	Estimates of the effect of the final rule on total litigation costs are not quantifiable. Litigation costs may rise or fall depending on firms' subsequent use of other contractual provisions and trade secret law and how the costs of such litigation compare to the cost of non-compete litigation, as well as the decreased uncertainty associated with a bright-line rule on non-competes.

TABLE 1—Continued

Category	Extent of characterization	Description of estimate	Discussion
Firm Expansion and Formation	Quantified	The final rule is estimated to increase new firm formation by 2.7–3.2% and decrease capital investment at incumbent firms by 0–7.9%. These effects represent a shift in productive capacity from incumbent firms to new firms. The overall effect on firm expansion and formation represents a distributional effect of the final rule.	New firm formation is generally a benefit, but may also crowd out incumbent firms and is therefore not a pure benefit. Decreased capital investment at incumbent firms may be counterbalanced by increased capital investment at new firms or rebalancing across industries, and therefore may or may not be a cost in net.
Distributional Effects on Workers	Not quantified or monetized	The rule may reduce the gender and racial earnings gap, may disproportionately encourage entrepreneurship among women, and may mitigate legal uncertainty for workers, especially relatively low-paid workers. The differential effect on different groups of workers represents a distributional effect of the final rule.	
Labor Mobility	Partially Monetized	Some firms may save on turnover costs (due to easier hiring as more potential workers are available), while some firms may have greater turnover costs (due to lost workers newly free from non-competes). The latter is estimated to be no more than $131 per worker with a non-compete, while estimates are not available to monetize the former. While it is unclear whether labor mobility costs represent a net cost or benefit of the final rule, they likely represent a distributional effect (costing firms which use non-competes and helping firms which do not) of the final rule.	The estimate of the increase in turnover costs for firms using non-competes is an upper bound, since it encompasses effects on investment in workers' human capital, hiring workers, and lost productivity of workers, all of which are expected to diminish under the final rule.

Note: Present values are calculated using discount rates of 2%, 3%, and 7%.

The Commission finds that, even in the absence of a full monetization of all costs and benefits of the final rule, the final rule has substantial benefits that clearly justify the costs. While data limitations make it challenging to monetize all the expected effects of the final rule, the Commission believes it has quantified the effects of the final rule likely to be the most significant in magnitude, and thus, potentially drive whether and the extent to which the final rule is net beneficial. This includes both benefits and costs. Based on those quantifications, the Commission is able to make conservative assumptions, based on its expertise, under which the final rule would be net beneficial. In this context, by conservative assumption, the Commission means that it is presuming the benefits it quantifies to be relatively low in value for purposes of this analysis, *i.e.,* lower than it believes is likely the case. With respect to costs, the Commission assumes costs are on the higher end of the estimated range, which is higher than the Commission believes is likely to be the case. Through this analysis, provided in detail in Part X.F.10, the Commission further bolsters its finding that the benefits of the final rule justify the costs.[1093]

Specifically, the Commission finds that even if only 5.5% of the estimated $400–$488 billion increase in worker earnings represents increased productivity resulting from improved, more productive matches between workers and employers, the benefits will outweigh the costs. In Part X.F.6.a, the Commission explains that the economic literature does not provide a way to separate increased productivity from the total effect on earnings (*i.e.,* transfers versus benefits in the regulatory impact analysis sense). However, the Commission finds that based on the literature, some part of the increase in worker earnings represents increased productivity and believes that 5.5%, and likely more, represents increased productivity. Similarly, even presuming that no part of the effect on earnings is a benefit (as opposed to a transfer), the Commission finds that if the social value of a patent were at least $297,144, then the monetizable benefits will exceed monetized costs. Notably, the literature finds that the average private value of a patent may be as high

[1093] The Commission notes that it does not believe there is a likely scenario in which firm exit and lost capital investment, especially when balanced against firm entry and gained capital investment at new firms, would change this outcome. Firm exit and lost capital investment, which are not quantified and are discussed as distributional effects in Part X.F.9, would not, for example, result in costs large enough to overcome the break-even analyses (even if, for example, the value of earnings representing productivity increases or the social value of patents had to be marginally higher) or the finding that the benefits justify the costs.

as $32,459,680, again making this assumption regarding the social value of a patent quite conservative. Finally, even presuming none of the earnings are benefits (rather than transfers) and that the social value of a patent is zero (an implausibly low estimate), if all the lost investment in human capital is core, the monetized benefits would also exceed monetized costs. Notably, in conducting these analyses, in each instance, the Commission further makes the very conservative assumption that monetizable benefits other than the benefit being analyzed are zero. That is, the Commission assumes that patents have no social value and that no reduced investment in human capital is core when considering how much of earnings must represent increased productivity in order for the monetized benefits to exceed the monetized costs. This break-even analysis shows that while data limitations making it challenging to monetize all of the expected benefits of the rule, the Commission finds that the final rule can be shown to be net beneficial even under very conservative assumptions.

F. Final Regulatory Analysis

1. Background

As discussed in Part IV.B.3.a, non-competes inhibit worker mobility, creating worse matches between workers and firms and decreasing workers' productivity and therefore their earnings. Non-competes also prevent firms from hiring talented and experienced workers; inhibit new business formation; and reduce the flow of innovative workers between firms, harming innovation. The final rule increases competition in labor markets by allowing workers to move more freely between jobs and increases competition in product and service markets by ensuring that firms are able to hire appropriate workers, that workers are able to create new entrepreneurial ventures, and that worker flow between firms enhances innovation.

2. Economic Rationale for the Final Rule

The final rule addresses two primary economic problems. First, non-competes tend to harm competitive conditions in labor markets. Non-competes increase barriers to voluntary labor mobility and prevent firms from competing for workers' services, thus creating frictions and obstructing the functioning of labor markets. These frictions inhibit the formation of optimal and efficient matches in the labor market, resulting in diminished worker and firm productivity and in lower wages.

The second economic problem is that non-competes tend to harm competitive conditions in product and service markets. Non-competes create a barrier to new business formation and entrepreneurial growth, which negatively affects consumers by lessening competition in product and service markets. Non-competes also make it difficult for competitors to hire talented workers, which reduces these competitors' ability to effectively compete in the marketplace. Additionally, non-competes impede innovation by preventing the churn [1094] of innovative workers between firms, limiting the spread and recombination of novel ideas, which may negatively affect technological growth rates.

3. Purpose of the Final Rule

The final rule provides that, with respect to a worker other than a senior executive, it is an unfair method of competition—and thus a violation of section 5 of the FTC Act—for a person to enter into or attempt to enter into a non-compete; enforce or attempt to enforce a non-compete; or represent that the worker is subject to a non-compete.[1095] The final rule also provides that, with respect to senior executives, it is an unfair method of competition—and thus a violation of section 5 of the FTC Act—for a person to enter into or attempt to enter into a non-compete; enforce or attempt to enforce a non-compete entered into after the effective date; or represent that the worker is subject to a non-compete, where the non-compete was entered into after the effective date.[1096]

4. Baseline Conditions

a. Estimate of the Affected Workforce

As described in Part II.E, some workers may not be subject to the final rule to the extent they are employed by an entity or in a capacity that is exempted from coverage under the FTC Act. The Commission estimates the fraction of the workforce who would be covered under the final rule (the ''coverage rate'') by applying conservative assumptions to individual-level data on the characteristics of the workforce from the American Community Survey (ACS) for 2017 to 2021.[1097] Residents of four States (California, Minnesota, North Dakota, and Oklahoma) are excluded from the sample used for the computation, since these States already generally do not enforce non-compete agreements.

To estimate the coverage rate, workers are classified according to three criteria: (1) whether the individual is identified as working for the government; (2) whether the individual is identified as working for a non-profit organization; and (3) whether the individual works in an industry or in a capacity that is likely to be outside the jurisdiction of the FTC Act. Government employment consists of employment with local, State, and Federal governments, in addition to individuals on active duty in the U.S. Armed Forces or Commissioned Corps. Nonprofit status is self-reported by survey respondents. Industries are defined based on the North American Industry Classification System (NAICS).

Such a classification of workers is necessarily imperfect as the FTC's jurisdiction does not exclude all workers that may be identified in the data as government employees or map directly into the data on non-profit status or the NAICS classifications that are available within the ACS. For example, the FTC Act is likely to exempt some firms that are classified as non-profits but not others, as described in Part II.E. Also, in some instances, only a subset of a given NAICS category (and not the entire category) appeared likely to fall outside the jurisdiction of the FTC Act. When ambiguity arose, the Commission was overinclusive in excluding workers. For example, the Commission classified all nonprofits as outside the coverage of the final rule for the purposes of estimating the coverage rate. Moreover, in estimating the coverage rate, the Commission excluded entire industries in calculating the coverage rate when some subset of that industry appeared to be outside the Commission's jurisdiction. This over-inclusiveness has the effect of underestimating the coverage rate of the final rule, and thus the overall net effect of the final rule will be conservative.

Using data from the ACS and the assumptions detailed in Part X.F.4, the Commission estimates that the final rule is likely to cover 80% of the private U.S. workforce.

b. Non-Compete Enforceability

For regulatory analyses, the effects of the final rule are measured against a baseline representing conditions that would exist in the absence of the rule. The extent of the final rule's costs and benefits depends on the degree to which it will change the enforceability of non-competes relative to what it would be in the baseline. Currently, non-competes are broadly prohibited in four States:

[1094] Churn in this context means turnover that is neither job creation nor job destruction—essentially the movement of workers among jobs.

[1095] *See* § 910.2(a)(1).

[1096] *See* § 910.2(a)(2).

[1097] The preliminary analysis in the NPRM did not estimate or apply a coverage rate based on jurisdiction.

California, North Dakota, Oklahoma, and Minnesota. In some other States, non-competes are prohibited for some, but not all, workers. For non-competes that are not prohibited expressly by statute, some version of a reasonableness test is used under State law to determine whether a given non-compete is enforceable or not. These reasonableness tests examine whether the restraint is greater than needed to protect an employer's purported business interest. Non-competes can also be found unreasonable where the employer's need for the non-compete is outweighed by the hardship to the worker or the likely injury to the public. Because these cases arise in the context of individual litigation, courts focus the ''likely injury to the public'' inquiry on the loss of the individual worker's services and not on the aggregate effects of non-competes on competition in the relevant market or overall in the economy.[1098]

Researchers have used various scoring systems to capture the enforceability of non-competes State by State over time. As described in Part IV.A.2, the Commission gives greatest weight to studies that measure enforceability granularly (*i.e.,* not using a binary score but, for example, an integer scale) and along various dimensions (*e.g.,* the employer's burden of proof in non-compete litigation and the extent to which courts are permitted to modify unenforceable non-competes to make them enforceable). The scoring system which fits these criteria best [1099] has been used to study the effect of non-compete enforceability on several economic outcomes. This score, which varies across States and across years, measures non-compete enforceability along a scale which runs from zero to one.[1100] A score of zero indicates enforceability equal to that of the State which enforces non-competes least (North Dakota). A score of one indicates enforceability equal to that of the State which enforces non-competes most readily (Florida). The final analysis relies on this score heavily as a granular and reliable scoring system that allows the Commission to consider the effect of non-compete enforceability on several economic outcomes. The studies that use this score form much of the basis for the final regulatory analysis.

5. Estimating the Effect of the Rule on a State-Level Enforceability Metric

In the absence of the rule, the average State enforceability score—in States that do not broadly prohibit them—when measured on a scale of 0 (lowest enforceability) to 1 (highest enforceability), is 0.78. The final rule will result in State-level enforceability of non-competes falling from its level in the absence of the rule to zero (*i.e.,* an average decrease of 0.78, excluding States that broadly prohibit non-competes).[1101] Using data on scores from 1991 to 2014, researchers report that the average magnitude of a change in the score (*i.e.,* the size of the change, regardless of whether it was a score increase or decrease) from year to year was 0.081.[1102] In other words, when a State's score changed from one year to the next, the average magnitude of that change was 0.081, on a scale of zero to one. Since the decrease that will result from the final rule is significantly larger than the average decrease considered in the literature (0.78 v. 0.081), the Commission considered different methods for the primary estimate in this final analysis. Consistent with the NPRM, this final analysis could attempt to scale up, or extrapolate, estimated effects to account for this larger decrease. As discussed in Part X.C, some commenters criticized this approach, stating that it may result in unreliable estimates absent evidence that the economic effects the Commission is attempting to measure would scale up linearly.

The Commission notes in X.C that empirical studies show a linear extrapolation is appropriate for measuring earnings effects.[1103] However, similar evidence supporting the use of linear extrapolation is not available for all economic outcomes the Commission is measuring in this final analysis. To maintain consistent reporting across economic outcomes and to avoid extrapolation, the final analysis considers the effect of a change equal to 0.081 when possible.[1104] That is, for the purposes of the final analysis, the Commission conservatively assumes the projected effects on economic outcomes due to the final rule are equal to the effects the economic literature associates with an average magnitude change in the non-compete enforceability score from year to year. The economic literature reports enforceability changes as simply increases or decreases in some studies,[1105] and the magnitude of those legal changes in this final analysis is assumed to mirror the average magnitude change of 0.081. The Commission makes these assumptions to avoid the possibility of inadvertently inflating the effects of changes in the enforceability score. The final rule will result in greater changes in enforceability than the changes examined in empirical studies. There is a possibility that the magnitude of change for particular economic outcomes will not be the same in response to every reduction in enforceability. For example, it is possible that for some economic outcomes, as enforceability gets closer to zero, the changes in the outcome being measured will be lower with each change in enforceability.

At the same time, the Commission notes that this may result in underestimating benefits of the final rule—the average magnitude change of 0.081 is much smaller than the average 0.78 change it would take for enforceability to reflect the final rule. To reflect this possibility, the final analysis includes sensitivity analyses which extrapolate beyond an average magnitude change. In these sensitivity

[1098] *See* NPRM at 3493–97 (describing the law governing non-competes at the time the NPRM was published). Minnesota prohibited non-competes after the publication of the NPRM. *See* Minn. Stat. Ann. sec. 181.988.

[1099] Bishara, *supra* note 501 at 751.

[1100] Different researchers have rescaled this score in different ways (*e.g.,* from zero to 470, or scaled such that the mean score is zero and the standard deviation of the score is one). The Commission uses the scaling from zero to one because that is the way it is used in the majority of the studies which are relied on in the final analysis, as well as for easy interpretability and consistency across the final analysis.

[1101] Calculated using data from 2009, the most recent year with publicly available data, and rescaled to a zero to one scale. *See* Starr, *supra* note 445.

[1102] Changes of zero (*i.e.,* years in which the score in a given State was the same as the prior year) were excluded from this calculation. The Commission notes that the study which reports this average (Johnson, Lipsitz, & Pei, *supra* note 526) was released after publication of the NPRM. The Commission also notes that the data underlying this calculation were used in other studies discussed in the NPRM; Johnson, Lipsitz, & Pei report the average score in the most accessible fashion and is therefore used here. The average they report is the average change in the analysis sample they select, which is chosen for analytical reasons to ensure accuracy of their estimates. Use of the underlying data to re-calculate the average score or use of scores provided by other researchers would not change the overall outcomes, conditional on sample selection. Moreover, the Commission reports the estimates resulting from a full extrapolation in this final analysis, which does not use this average score change in its sensitivity analysis, and is the method used in the NPRM. As noted, the Commission believes that the full extrapolation method is a valid, but potentially less precise method. Accordingly, the use of this score supplements—but is not necessary to support—the Commission's ultimate finding that the benefits to the final rule justify the costs.

[1103] Johnson, Lavetti, & Lipsitz, *supra* note 388 at 17.

[1104] When considering studies which do not report the relationship between non-compete enforceability and economic outcomes based on a numeric score, the Commission is unable to scale the effect to reflect the average magnitude change of 0.081.

[1105] *See, e.g.,* Jeffers, *supra* note 450.

analyses, the estimated effects from the empirical literature are scaled up on a State-by-State basis (rather than taking the average) to account for the estimated size of the decrease in each State's score. The Commission notes that linear extrapolation provides a robust estimate of earnings changes based on the empirical literature, but for consistency, the Commission reports effects based on the average magnitude change as its primary analysis.

6. Benefits of the Rule

The Commission finds several benefits attributable to the final rule, as reflected in part by the effects of the rule on earnings and prices, and all the effects on output and innovation, as summarized in Table 1 in Part X.E.

a. Earnings

The Commission finds labor markets will function more efficiently under the final rule, which will lead to an increase in earnings or earnings growth. Specifically, in this regulatory analysis, the Commission finds that the estimated ten-year present discounted value of increased worker earnings is $400–$488 billion. The final rule will result in additional earnings stemming from improvements in allocative efficiency due to more productive matching between businesses, which are economic benefits. In other words, the increase in worker mobility will allow employers to hire workers who are a better, more productive fit with the positions they are seeking to fill, which in turn will increase productivity overall. A portion of the additional earnings are transfers from firms to workers resulting from more plentiful employment options outside the firm,[1106] as workers who are not bound by non-competes will be in a different bargaining position with their employer. To the extent other better opportunities with different employers exist for a given worker, their current employers will now be competing with those other employers and may increase worker compensation to keep those workers. The Commission finds that the economic literature does not provide a way to separate the total effect on workers' earnings into transfers and benefits.

The increase in worker earnings resulting from the final rule is calculated as follows:

*Increase in worker earnings = (% Increase in Earnings caused by the change in enforceability of non-competes) * (Total Affected Earnings)*

The primary approach in this analysis is to estimate the percentage increase in earnings assuming that the effect of the final rule will be the same as the effect of an average magnitude change in non-compete enforceability, as discussed in Part X.F.5. The Commission estimates the percentage increase in workers' earnings to be 0.86%.[1107] The Commission estimates total affected annual earnings to be $6.2 trillion (in 2023 dollars).[1108]

Multiplying the percentage effect (0.86%) by overall affected annual earnings ($6.2 trillion) results in an annual earnings effect of $53 billion. The ten-year effect on earnings, discounted separately by 2%, 3%, and 7%, is reported in the first row of Table 2.[1109]

This primary approach requires no extrapolation (*i.e.,* it does not scale the effect on economic outcomes to account for the fact that the effect of the rule on enforceability scores will be greater than the changes studied in the economic literature). However, it may understate the increase in workers' earnings resulting from the final rule. Thus, the Commission conducts two sensitivity analyses to assess how the estimated effect of the rule would change if effects are extrapolated to represent changes in enforceability scores greater than those examined in the literature.

The first sensitivity analysis, hereafter referred to as the ''full extrapolation'' approach, calculates the effect on worker earnings in an identical fashion to the primary analysis but relies on an estimate of the percentage increase in worker earnings which extrapolates to the effect of a complete prohibition on the use of non-competes. This results in an effect on worker earnings equal to 3.2% (instead of 0.86% in the primary analysis).[1110] For this estimate, total affected earnings are equal to $7.3 trillion in 2023 dollars.[1111] The estimated effect on earnings across the workforce for this first sensitivity analysis is therefore given by the percentage effect on earnings (3.2%) multiplied by the total annual wages in the U.S. for the affected population ($7.3 trillion). This results in an annual

[1106] By transfers, the Commission refers to ''a gain for one group and an equal-dollar-value loss for another group.'' *See* Off. of Mgmt. & Budget, *Circular A–4* (Nov. 9, 2023), 57, *https://www.whitehouse.gov/wp-content/uploads/2023/11/CircularA-4.pdf.*

[1107] Calculated as $-(e^{-0.107*0.081}-1)$, where -0.107 is the estimated coefficient of earnings on non-compete enforceability score in Johnson, Lavetti, & Lipsitz (*supra* note 388), and 0.081 represents the size of an average magnitude change calculated in Johnson, Lipsitz, & Pei (*supra* note 526) which scales the effect to represent the effect of an average sized change in the non-compete enforceability score.

[1108] This figure represents total annual earnings in the U.S. in the most recent year with data available (2022), adjusted to 2023 dollars: see *https://data.bls.gov/cew/apps/table_maker/v4/table_maker.htm#type=0&year=2022&qtr=A&own=5&ind=10&supp=0.* Earnings from California, North Dakota, Oklahoma, and Minnesota (States which broadly do not enforce non-competes) are subtracted out, since enforceability in those States will be broadly unaffected by the rule. The estimate is additionally adjusted to account for the proportion of the workforce the Commission estimates are currently covered by the Commission's jurisdiction (80%), as discussed in Part X.F.4.a. Numerically, $6.2 trillion is calculated as ($9.1 trillion − $1.6 trillion) * 80% = $6.0 trillion, adjusted to $6.2 trillion to adjust to 2023 dollars. $9.1 trillion is total private earnings in 2022 in the U.S. (the most recent year with data available), and $1.6 trillion is total private earnings in 2022 in CA, ND, OK, and MN.

[1109] For illustrative purposes, State-specific estimates are displayed in Appendix Table A.1. In this table, the estimated number of covered workers is calculated as 80% * (total employed population in the State); the estimated increase in total earnings is calculated as 0.86% * (estimated total covered earnings), where estimated total covered earnings is calculated as (estimated number of covered workers) * (average annual earnings); and the estimated increase in average earnings is calculated as 0.86% * (average annual earnings). Total employed population and average annual earnings are taken from the Census Bureau Quarterly Census of Employment and Wages for 2022 (see *https://www.bls.gov/cew/data.htm*).

[1110] The percentage effect, 3.2%, is reported by Johnson, Lavetti, & Lipsitz (*supra* note 388) as the lower end of a range of possible effects of a ban on non-competes, relative to non-compete enforceability in 2014. The estimate is constructed by calculating the change in the enforceability score in each State which would bring that State's score to zero (representing no enforceability of non-competes) and scaling the estimated effect on worker earnings by that amount. The Commission uses the low end of the reported range in order to exercise caution against extrapolation, since the estimate uses an out-of-sample approximation: the changes in most States necessary to arrive at a score of zero are greater than the changes examined in the study (though this approximation is consistent with the results of a test in Johnson, Lavetti, and Lipsitz which shows that the effect of enforceability on earnings is roughly linear: namely, a change in enforceability that is twice as large results in a change in earnings that is twice as large). The Commission also notes that the estimated range is based on enforceability in 2014. Since then, some changes in State law have made non-competes more difficult to enforce for subsets of their workforces so that a prohibition on non-competes today is likely to have a slightly lesser effect than a prohibition would have had in 2014.

[1111] This estimate differs from total affected earnings for the primary analysis because the estimate of 3.2% takes into account enforceability in California, North Dakota, and Oklahoma. Earnings in those States is therefore added back into total affected earnings. However, earnings in Minnesota are still omitted, since the prohibition in that State was enacted after the conclusion of the study period in Johnson, Lavetti, and Lipsitz (2023): see Minn. Stat. sec. 181.988. Total annual earnings in the U.S. for the affected population excluding MN are calculated as ($9.1 trillion − $0.2 trillion) * 80%, updated to adjust to 2023 dollars. $9.1 trillion is earnings for all workers in the US in 2022 (the most recent year with available data) and $0.2 trillion is earnings for workers in MN. *See https://data.bls.gov/cew/apps/table_maker/v4/table_maker.htm#type=0&year=2022&qtr=A&own=5&ind=10&supp=0.*

estimated earnings gain of $234 billion.[1112] The ten-year effect, discounted at 2%, 3%, and 7%, is displayed in the second row of Table 2.

The second sensitivity analysis, hereafter referred to as the ''partial extrapolation'' approach, uses the same formula as the other two analyses (% effect on earnings * total affected earnings) but is more conservative in its estimate of the percent effect on earnings than the full extrapolation estimate. The full extrapolation approach assumes that enforceability scores fall to zero. The partial extrapolation approach instead assumes that enforceability scores fall to the minimum observed enforceability score ignoring scores in States that broadly prohibit non-competes (a more moderate extrapolation). The minimum observed enforceability score excluding States that broadly prohibit non-competes is 0.53 (on a scale of zero to one), which is the enforceability score in New York.[1113] This analysis calculates the change in each State's score that would bring it to 0.53, and scales the effect on worker earnings estimated in the empirical literature by that amount.[1114] For example, West Virginia's enforceability score is 0.59. To change to New York's enforceability score would imply a decrease in West Virginia's score of 0.06 (calculated as 0.59—0.53). This implies a percent effect on earnings in West Virginia of 0.64%.[1115]

Total affected earnings in each State are calculated by multiplying total earnings in that State (adjusted to 2023 dollars) by the estimated percentage of covered workers (80%). For example, in West Virginia, total earnings are estimated to be $0.24 trillion.[1116]

Next, the percent increase in earnings in each State is multiplied by total affected earnings in that State. In West Virginia, this results in an earnings increase of 0.64% * $0.24 trillion = $152 million. Finally, the earnings increases are added across States. The overall estimated effect is an annual increase in earnings of $161 billion. The ten-year effect, discounted at 2%, 3%, and 7%, is displayed in the third row of Table 2.

TABLE 2

	Estimated ten-year increase in earnings ($ billions), assuming:		
	2% Discount rate	3% Discount rate	7% Discount rate
Primary estimate (average enforceability change)	$488	$468	$400
Estimate (full extrapolation)	2,148	2,060	1,762
Estimate (partial extrapolation)	1,488	1,427	1,221

The estimated effects on earnings in Table 2 are based on estimates of the percentage change in earnings from a study in the empirical literature that aligns with the metrics outlined in Part IV.A.2. Another study in the literature estimates earnings effects using a comparison between workers in occupations that use non-competes at a high rate versus a low rate.[1117] After adjusting the finding from that study to the average magnitude enforceability change, the estimated effect on worker earnings is 0.5%,[1118] or $31 billion annually.[1119]

The Commission notes that, as discussed in Part X.E, earnings of senior executives who continue to work under non-competes are included in the calculations in this Part X.F.6.a. If the Commission were able to identify those senior executives, their omission from the calculations would decrease the earnings effect of the final rule, since the earnings effect for those senior executives (and others, because of spillovers) would be pushed further into the future, causing steeper discounting. However, while senior executives are paid relatively highly, there are relatively few of them: for example, based on BLS data on earnings by occupation, Chief Executives' earnings comprise just 0.5% of all earnings.[1120] Therefore, the impact on the earnings calculations of omitting or pushing forward the earnings of senior executives who would continue to work under a non-compete is limited.

Discussion of Transfers Versus Benefits

It is difficult to determine the extent to which the earnings effects represent transfers versus benefits. Transfers, in this context, refer to ''a gain for one group and an equal-dollar-value loss for another group.'' [1121] Such transfers do not represent a net benefit or cost to the economy as a whole for purposes of regulatory impact analysis.

To the extent a prohibition on non-competes leads to greater competition in the labor market and a more efficient allocation of labor by allowing workers to sort into their most productive

[1112] This estimate is comparable to the estimate of $250 billion per year reported in the NPRM. *See* NPRM at 3523. The estimate in the NPRM was based on earnings in 2020 (as opposed to 2022 in this final regulatory analysis), included earnings in Minnesota (which has since passed a bill prohibition non-competes), and did not adjust for the estimate of the affected workforce discussed in Part X.F.4.a.

[1113] Enforceability score data come from Starr (2019), which reports scores for 2009 (the most recent data available). Scores are adjusted to a scale of zero to one.

[1114] In particular, for each State, the Commission calculates the percentage effect on earnings as $e^{(0.107*\Delta Enf)}-1$, where ΔEnf is equal to the enforceability score in that State minus the lowest observed enforceability score, excluding CA, ND, OK, and MN (0.53).

[1115] Calculated as $-(e^{-0.107*0.064}-1)$, where −0.107 is the estimated coefficient of earnings on non-compete enforceability score in Johnson, Lavetti, & Lipsitz (*supra* note 388), and 0.064 represents the scaling factor due to West Virginia's score change.

[1116] Calculated as $0.29 trillion * 80%, where $0.29 trillion is earnings in WV in 2022 (the most recent year with data available) adjusted to 2023 dollars. See *https://data.bls.gov/cew/apps/table_maker/v4/table_maker.htm#type=0&year=2022&qtr=A&own=5&ind=10&supp=0.*

[1117] For further discussion of this study, see the discussion in Part IV.B.3.a.ii of Starr, *supra* note 445.

[1118] The change in enforceability which generates the estimate in Starr (*supra* note 445) is a one standard deviation change, as measured using non-compete enforceability scores for all 50 States and the District of Columbia in 1991, which is a change on a scale of zero to one of approximately 0.17, calculated as 1/[1.60−(−4.23)]. Scaling the estimate, a change equal to 0.081 would result in an earnings effect of 0.5%, calculated as $e^{(0.0099*0.081/0.172)}-1$.

[1119] Calculated as $6.2 trillion * 0.5%.

[1120] Calculated as (199,240 * 246,440)/(147,886,000 * 61,900), where 199,240 and 147,886,000 are employment for Chief Executives and All Workers, respectively, and 246,440 and 61,900 are dollar earnings for Chief Executives and All Workers, respectively, in 2022. See Occupation Employment and Wage Statistics, BLS, *https://www.bls.gov/oes/tables.htm.* The Commission notes that Chief Executives are used as an illustrative example, and are an imperfect proxy for senior executives: some Chief Executives (as classified by BLS) may not be senior executives under the final rule, and some senior executives under the rule may not be Chief Executives.

[1121] Off. of Mgmt. & Budget, *Circular A–4* (Nov. 9, 2023) at 57.

matches with firms (including new firms that may be formed), then the resulting earnings increases may reflect higher productivity and so represent a net benefit to the economy. However, some increases in earnings when non-competes are prohibited may simply represent a transfer of income from firms to workers (or, if firms pass labor costs on to consumers, from consumers to workers).

Several pieces of evidence support the Commission's finding that at least part of the increase in earnings represents a social benefit or net benefit to the economy, rather than just a transfer. As described in Part IV.B.3.a.ii, two studies have sought to estimate the external effect of non-compete use or enforceability: that is, the effect of use or enforceability on individuals other than those directly affected by non-compete use or enforceability.

One study directly estimates the external effect of a change in non-compete enforceability.[1122] While use of non-competes is not observed in the study, the effects of changes in a State's laws are assessed on outcomes in a neighboring State. Since the enforceability of the contracts of workers in neighboring States are not affected by these law changes, the effect must represent a change related to the labor market which workers in both States share. The estimate suggests that workers in the neighboring State experience effects on their earnings that are 76% as large as workers in the State in which enforceability changed.[1123] In other words, two workers who share a labor market would experience nearly the same increase in their earnings from a prohibition on non-competes, even if the prohibition only affects one worker. While the study does not directly estimate the differential effects by use, the effects on workers unaffected by a change in enforceability may be similar to the effects on workers not bound by non-competes.

A second study demonstrates that when the use of non-competes by employers increases, wages decrease for workers who do not have non-competes but who work in the same State and industry. This study also finds that this effect is stronger where non-competes are more enforceable.[1124] Since the affected workers are not bound by non-competes themselves, the differential in earnings likely does not completely represent a transfer resulting from a change in bargaining power between a worker bound by a non-compete and their employer.

Overall, these studies suggest there are market-level dynamics governing the relationship between earnings and the enforceability of non-competes: specifically, restrictions on the enforceability of non-competes affect competition in labor markets by alleviating frictions and allowing for more productive matching. Changes in enforceability or use of non-competes have spillover effects on the earnings of those workers who should not be directly affected because they do not have non-competes or they work in nearby labor markets that did not experience changes in enforceability. If non-competes simply changed the relative bargaining power of workers and firms, without affecting market frictions or competition, then these patterns are less likely to be observed. Additionally, new business formation when non-competes are less enforceable (see Part IV.B.3.b.i for a discussion of the evidence) may create new productive opportunities for workers.

Due to the uncertainty related to earnings as transfers versus benefits, the Commission analyzes various scenarios that allocate the percent of the earnings effect to a benefit at different levels in Part X.F.10. This does not represent a finding that no part or only a small part of the effect on earnings is a benefit; rather, it is to ensure that the total estimated effect of the final rule is robust for the purposes of the regulatory impact analysis to the possibility that a small percentage of the effect on earnings represents a net benefit.[1125]

b. Innovation

The Commission finds that an additional benefit of the rule would be to increase the annual count of new patents by 3,111–5,337 in the first year, rising to 31,110–53,372 in the tenth year. By alleviating barriers to knowledge-sharing that inhibit innovation, and by allowing workers greater opportunity to form innovative new businesses, the final rule will increase innovation. Studies have sought to directly quantify this effect, primarily focused on patenting activity. The Commission therefore considers the effect on patenting in support of its findings related to innovation. Lacking an estimate of the social value of a patent, the Commission does not monetize this benefit. The Commission also finds that the rule will reduce expenditure on R&D by $0 to $47 billion per year. In light of the increase in overall innovation, this reduction is a cost savings for firms, but may not reflect a market-level effect because it does not measure potential expenditure on R&D by new firms formed as a result of the final rule. The change in patenting due to the rule for each year is calculated as follows:

*Increase in # of Patents = (% Increase in Patenting) * (Total # of Affected Patents)*

The Commission estimates the percentage increase in patenting to average 10.9%–18.7% annually over a ten-year period,[1126] which is the percentage effect on patenting of an average magnitude change in non-compete enforceability, as discussed in Part X.F.5. The Commission assumes that the full effect on patenting phases in over the course of a ten-year period, resulting in an effect of 2.0%–3.4% in the first year, increasing to 19.8%–34.0% by the tenth year.[1127] The total number of affected patents in each year is 156,976.[1128]

The results of the analysis, for the top and bottom end of the reported range of percentage increases in patenting, are displayed in Table 3.

As a sensitivity analysis, mirroring the analysis in Part X.F.6.a, the Commission assumes that enforceability scores in each State will fall to the lowest observed score among States which do not broadly prohibit non-competes. The Commission calculates the percentage change in patenting in each State by extrapolating the

[1122] Johnson, Lavetti, & Lipsitz, *supra* note 388.

[1123] *Id.* (note: a new version of this paper, posted in 2023 after the NPRM was published, revised this estimate slightly).

[1124] Starr, Frake, & Agarwal, *supra* note 469.

[1125] The Commission notes that Part IV.B.3.a.ii does not measure or consider whether earnings are transfers or benefits because to the extent that the earnings that are transfers represent firms' ability to suppress earnings using an unfair method of competition, the transfer of such earnings from firms to workers through the use of non-competes still reflect the tendency of non-competes to negatively affect competitive conditions in the labor market.

[1126] These values represent the range reported in Johnson, Lipsitz, & Pei, *supra* note 526, considering both raw patent counts and patent counts weighted by a measure of their quality: the number of citations received in the five years after the patent is granted. The findings by Johnson, Lipsitz, & Pei are qualitatively confirmed in the literature, with similar estimates generated by He (*supra* note 560)—a study discussed in the NPRM—and Rockall & Reinmuth (*supra* note 564).

[1127] This analysis assumes that the effect on patenting increases by an identical amount each year (2.0–3.4%), ensuring that the overall average annual change is equal to that reported in Johnson, Lipsitz, & Pei (*supra* note 526).

[1128] This is the number of granted utility patents, which are patents for new or improved innovation and are the types of patents studied by Johnson, Lipsitz, & Pei (*Id.*). The figure comes from 2020, which is the most recent data available from the U.S. Patent and Trademark Office. It excludes States in which non-competes are not enforceable (California, Oklahoma, North Dakota, and Minnesota). Data available at *https://www.uspto.gov/web/offices/ac/ido/oeip/taf/st_co_20.htm.*

percentage increase in patenting to reflect the size of the change in that State's enforceability score. For example, as noted in Part X.F.6.a, West Virginia's score would fall from 0.59 to 0.53 as a result of this analysis. The percentage change in patenting in West Virginia would therefore average 9.0%–16.6%,[1129] resulting in an increase of 1.9%–3.6% in the first year, rising to 19.2%–35.6% by the tenth year.

The annual State-specific percentage changes are multiplied by the number of annual patents granted in each State.[1130] Finally, the changes in patenting across States are combined across States for a national estimate. The results are reported in Table 3. As States have broadly decreased legal enforceability of non-competes in recent years, the changes necessary to move to lower enforceability are likely overestimated in this sensitivity analysis. This causes the values estimated by this method to likely overestimate the true extent of the benefit.

TABLE 3

Year relative to publication of the rule	Estimated annual count of additional patents using low estimate of innovation effect	Estimated annual count of additional patents using high estimate of innovation effect	Estimated annual count of additional patents using low estimate of innovation effect and extrapolation approach	Estimated annual count of additional patents using high estimate of innovation effect and extrapolation approach
1	3,111	5,337	8,927	19,306
2	6,222	10,674	17,853	38,611
3	9,333	16,012	26,780	57,917

5	15,555	26,686	44,633	96,528
6	18,666	32,023	53,560	115,833
7	21,777	37,360	62,486	135,139
8	24,888	42,697	71,413	154,444
9	27,999	48,035	80,339	173,750
10	31,110	53,372	89,266	193,055

The Commission is not aware of estimates that assess the overall social value of a patent and therefore the Commission does not monetize the estimated effects on innovative output. Estimates of the effect of a patent on a firm's value in the stock market exist in the empirical literature,[1131] as do estimates of the sale value of a patent at auction.[1132] However, those estimates do not include the effects on follow-on innovation, consumers (who may benefit from more innovative products), competitors, or the rents that are shared with workers, and instead reflect solely the private effect of a patent to the relevant firms.

The Commission notes that patent counts may not perfectly proxy for innovation. However, by using citation-weighted patents, as well as other measures of quality, the study by Johnson, Lipsitz, and Pei shows that patent quality, not just patent quantity, increase when non-competes become less enforceable.[1133] Similarly, the study by He shows that the value of patents also increases when non-competes become less enforceable.[1134]

The second effect of the final rule associated with innovation is a possible change in spending on R&D. The change in R&D spending due to the final rule is calculated as follows:

Reduction in R&D Spending = (% Reduction in Spending) * (Total Affected Spending)

The Commission estimates that the percentage reduction in spending is 0–8.1%, with the broad range reflecting disagreement in the empirical literature.[1135] Total affected spending is $575 billion (in 2023 dollars).[1136] Multiplying the percentage effect by total affected spending, the overall annual effect is a reduction of $0-$47 billion in R&D spending in 2023 dollars.

The Commission notes that, in light of the increases in innovation identified in this Part X.F.6.b, reductions in R&D spending represent a cost savings for firms. Put differently, reductions in R&D spending may cause commensurate reductions in innovative output. Insofar as reductions in R&D spending resulting from the rule could have countervailing effects on innovation, the estimated increase in innovative output represents the net effect, which would otherwise be even larger, if R&D spending were held constant.

Notably, empirical estimates of R&D spending are based on observed changes among incumbent firms and therefore may not reflect market-level effects. Decreased investment at the firm level (the level of estimation in the studies that report effects of enforceability on R&D spending) does not necessarily mean that investment would decrease at the market level, since new firms entering the market may contribute additional R&D spending not captured in the referenced studies. For these reasons, the Commission stops short of classifying the effect on R&D spending as a benefit of the final rule.

The Commission notes that, as discussed in Part X.E, the estimated effects on innovation do not take into account that some senior executives

[1129] Calculated as $e^{(1.43*0.06)}-1$ and $e^{(2.56*0.06)}-1$, where 1.43 and 2.56 represent the coefficients reported in Johnson, Lipsitz, & Pei (*Id.*) as the lower and upper bounds of the reported coefficient range, and 0.06 is the decline in the enforceability score in West Virginia.

Stats., *U.S. R&D Increased by $51 Billion in 2020 to $717 Billion; Estimate for 2021 Indicates Further Increase to $792 Billion* (Jan. 4, 2023), *https://ncses.nsf.gov/pubs/nsf23320.* Note that the data are not broken out by State, and therefore the final analysis cannot exclude CA, ND, OK, and MN.

may continue to work under non-competes under the rule. The Commission is unable to separate the effects of senior executives' non-competes from other workers' non-competes on innovation. Some effects estimated in this Part X.F.6.b may occur further in the future than assumed in this analysis, based on the extent of continued use of non-competes for senior executives.

Overall, the Commission finds that the final rule will significantly increase innovation. Furthermore, the increase in innovation may be accompanied by a decrease in spending on R&D that would, thus, be a cost saving to firms.

c. Prices

The Commission finds that consumer prices may fall under the final rule because of increased competition. The only empirical study of this effect concerns physician practice prices. Based on this study, the Commission estimates the ten-year present value reduction in spending for physician and clinical services from the decrease in prices is $74–$194 billion. The Commission finds some of the price effects may represent transfers from firms to consumers and some may represent benefits due to increased economic efficiency. Some of the benefits may overlap with benefits otherwise categorized, such as benefits related to innovation.

The decrease in prices for physician services because of the final rule is calculated as follows:

*Decrease in Prices = (% Decrease in Prices) * (Total Affected Spending)*

The Commission estimates the percentage decrease in prices for physician services to be 3.5%.[1137] Total spending on physician and clinical services was $801 billion in 2023 dollars, excluding States that broadly do not enforce non-competes.[1138] The Commission separately multiplies spending by 35%, 61.9%, and 75% (estimates of the proportion of hospitals covered by the Commission's jurisdiction as a proxy for total physician and clinical services spending covered by the Commission's jurisdiction) to arrive at total affected spending.[1139] The ten-year sum of discounted spending decreases for these analyses are presented in Table 4.

As a sensitivity analysis, mirroring the analysis in Part X.F.6.a, the Commission assumes that enforceability scores in each State will fall to the lowest observed score among States which do not broadly prohibit non-competes. The Commission calculates the percentage change in prices in each State by extrapolating the percentage decrease in prices to reflect the size of the change in that State's enforceability score. As noted in Part X.F.6.a, West Virginia's score would fall from 0.59 to 0.53 as a result of this analysis. The percentage decrease in prices in West Virginia would therefore be 2.5%.[1140] This percentage decrease is multiplied by State-specific physician spending, adjusted by the relevant multiplier to account for the Commission's jurisdiction, and summed over States.

The ten-year present discounted value of the spending decreases estimated by this analysis are presented in Table 4.

TABLE 4

	Assumed percent of physicians covered (%)	Estimated spending reduction over ten years (billions of dollars) assuming:		
		2% Discount rate	3% Discount rate	7% Discount rate
Primary estimate (average magnitude enforceability change)	35	$90	$87	$74
	61.9	160	153	131
	75	194	186	159
Sensitivity analysis (partial extrapolation approach)	35	257	247	211
	61.9	455	437	373
	75	552	529	459

Several effects of the final rule, including changes in capital investment, new firm formation, and innovation, may possibly filter through to consumer prices. Prices, therefore, may act as a summary metric for the effects on consumers. The Commission notes, however, that prices are an imperfect measure for the effect on consumers. For example, increased innovation catalyzed by the final rule could result in quality increases in products, which might increase prices (all else equal), but nevertheless, consumers may be better off. New firm formation may result in a broader set of product offerings, even if prices are unaffected. Finally, some portion of this effect may represent a transfer from physician practices to consumers. For all these reasons, as well as to avoid double-counting (since prices may reflect changes in innovation, investment, market structure, wages, and other outcomes that are measured elsewhere), the Commission considers evidence on prices to be corroborating evidence, rather than a unique cost or benefit, though some portion of the total effect likely represents a standalone benefit of the rule. The Commission also notes increased competition brought about by the final rule will likely increase

[1137] 3.5% is calculated as $-(e^{(0.427 * 0.081)} - 1)$, where 0.427 is the coefficient relating non-compete enforceability and physician prices in Hausman & Lavetti (*supra* note 590), and 0.081 represents the average magnitude non-compete enforceability score, as described in Part X.F.5.

[1138] See *https://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/NationalHealthExpendData/NationalHealthAccountsStateHealthAccountsProvider*. Spending in 2020, the most recent year with available data, was $679 billion, which is $801 billion adjusted to 2023 dollars. CA, ND, OK, and MN are omitted.

[1139] In the absence of data on the percentage of physician practices that are non-profit, the Commission uses a range of three different assumptions on the share of covered hospitals. In the first two scenarios, the Commission assumes that the set of covered hospitals is all hospitals that are not non-profit. The first scenario uses 2020 data from the American Hospital Association indicating that 65% of hospitals report that they are non-profits (based on data available at *https://www.ahadata.com/aha-dataquery*). The second scenario uses 2017–2021 data from the American Community Survey indicating that 38.1% of hospital employment is at non-profits (see *https://www.washingtonpost.com/business/2023/05/12/force-behind-americas-fast-growing-nonprofit-sector-more)*. Finally, consistent with the Commission's findings in Part V.D.4, the percentages of firms that report themselves as nonprofit in the data, which reflects registered tax-exempt status under IRS regulations, does not equate to the Commission's jurisdiction. It is likely the Commission may have jurisdiction over some hospitals and other healthcare organizations identified as nonprofits. Therefore, the third scenario assumes that 75% are covered.

[1140] Calculated as $e^{(0.427 * 0.06)} - 1$, where 0.427 is the coefficient reported in Hausman and Lavetti (*supra* note 590), and 0.06 is the decline in the enforceability score in West Virginia.

consumer quantity, choice, and quality. These effects are not quantified in the literature.

To draw inferences to other industries, the Commission notes that if the relationship between non-compete enforceability and prices observed in healthcare markets holds in other industries, then under the final rule prices would likely decrease, and product and service quality would likely increase. Insofar as such effects may be driven by increases in competition, as discussed in Part IV.B.3.b.iii, *e.g.,* because of new firm formation, it is likely output would also increase. However, the evidence in the literature addresses only healthcare markets and therefore the Commission cannot say with certainty that similar price effects would be present for other products and services.

In many settings, it is possible that increases in worker earnings from restricting non-competes may increase consumer prices because of higher firms' costs.[1141] There is no empirical evidence that enforceability of non-competes increase prices due to increased labor costs. Additionally, greater wages for workers freed from non-competes may result from better worker-firm matching, which could simultaneously increase wages and increase productivity, leading to lower prices.

The Commission notes that, as discussed in Part X.E, the estimates of the effect of the rule on prices do not separately account for the effect of senior executives who may continue to have non-competes under the rule. The Commission is unable to monetize or quantify these effects separately because there is no accounting in the applicable literature of why, nor to which groups of workers, the observed price effects occur. If such non-competes have a large impact, some of the effects estimated in this section may occur further in the future than described in this Part X.F.6.c.

7. Costs of the Final Rule

The Commission finds costs associated with the final rule, including legal and administrative costs, and possibly costs related to investment in human capital and litigation, as summarized in Table 1 in Part X.E. The Commission notes the final analysis includes effects on investment in human capital and litigation costs in this Part X.F.7 discussing costs associated with the final rule, though it is not clear whether effects associated with investment in human capital are costs or benefits, and it is not clear whether litigation costs would rise or fall under the final rule.

a. Investment in Human Capital

The Commission estimates the ten-year present discounted value of the net effect of the final rule on investment in human capital (*i.e.,* worker training) ranges from a benefit of $32 billion to a cost of $41 billion. The Commission notes that this wide range represents substantial uncertainty in the interpretation of the estimates that exist in the economic literature. The estimates contained in this Part X.F.7.a are separated along lines created by that uncertainty.

There are two primary sources of uncertainty. The first pertains to the extent to which lost investment in human capital is ''core'' versus ''advanced.'' As discussed in Part IV.B.3.b.ii, when non-competes are enforceable, fewer workers will be available due to decreased labor mobility, including workers who would be a good skills match for a particular job, as well as workers moving to new industries to avoid triggering a potential non-compete clause violation. This may require retraining of workers forced into a new field that would not otherwise be necessary for an experienced worker within the same industry. The departure of experienced workers from the industry also means firms will be required to invest in the human capital of inexperienced workers who replace them. This type of investment in training to address a skills mismatch—which is referred to as the ''core'' training scenario—contrasts with what is referred to as the ''advanced'' training scenario, which is investment in training that builds upon the productivity of workers who may already be experienced in an industry. Insofar as reductions in investment in human capital due to the final rule represent reductions in core investment, the rule will save firms money and will additionally not require workers to forgo time spent producing goods and services to train. Therefore, such reductions would represent a benefit of the final rule. However, insofar as reductions in investment in human capital from the final rule represent reductions in advanced investment, there may be productivity losses for workers. The estimates in the literature do not allow the Commission to distinguish between the types of forgone human capital investment in the final analysis. This final analysis therefore separately estimates the effects assuming lost investment in human capital is core and assuming it is advanced.

The second source of uncertainty pertains to the specific estimates of the effect of non-compete enforceability on investment of human capital. Starr (2019) estimates the differential effect of non-compete enforceability on training in occupations which use non-competes at a high rate versus those that use non-competes at a low rate but does not estimate the absolute effect on investment across the workforce. Therefore, this final analysis separately estimates the effects on training under two different assumptions—that the increase in training due to greater non-compete enforceability affects all workers, or only workers in high-use occupations—to demonstrate how this uncertainty affects the estimates.[1142]

The Commission notes that some of the estimates described in this Part X.F.7 may overlap with estimates reported in other sections of the regulatory analysis. For example, if decreased enforceability of non-competes decreases investment in workers' human capital, and this decreased investment would be reflected in lower wages for workers, then the estimate of the wage increase resulting from the final rule will already account for the extent to which decreased investment decreases wages. That is, if investment were held constant, the earnings increase associated with the final rule may be even larger.

i. Estimates Assuming Lost Investment in Human Capital Is Core Training

The first set of estimates assumes that all lost training is core. This results in estimated effects of the final rule that represent upper bounds on the benefits associated with the final rule's effect on investment in human capital. In these scenarios, the final rule will allow firms to hire experienced workers instead of needing to provide costly training to workers new to the industry or a position. The change in investment in core training brought about by the rule is calculated as follows:

Effect of Decreased Investment in Core Training = Additional Output of

[1141] Sebastian Heise, Fatih Karahan, & Ayşegül Şahin *The Missing Inflation Puzzle: The Role of the Wage-Price Pass-Through,* 54 J. Money, Credit & Banking 7 (2022).

[1142] Whether this assumption yields an overestimate or underestimate depends on what happens to training of workers in occupations with a low-rate of non-competes use when the enforceability of non-competes changes. If the effect of a change in non-compete enforceability on workers in occupations that use non-competes at a low rate is small, this assumption yields an overestimate of the overall effect on training. If the effect on those workers is large, it results in an underestimate.

Workers Resulting From Less Time Spent Training + Reduced Direct Outlays on Training

Additional Output of Workers Resulting From Less Time Spent Training

The first component is additional output of workers resulting from less time spent on otherwise unnecessary training if they were better matched with firm and industry. The change in the output of workers from less time spent training because of the final rule is calculated as follows:

*Additional Output of Workers Resulting From Less Time Spent Training = (Total # of Affected Workers) * (Percentage Point Decrease in Trained Workers) * (Average Hours Spent Training Per Worker) * (Average Hourly Output of Workers)*

The Commission estimates the total number of affected workers as 101.1 million workers, assuming all workers are affected, and 45.3 million workers, assuming only workers in high-use occupations are affected.[1143] The percentage point decrease in trained workers is estimated to be 0.4.[1144] Average hours spent training per worker is estimated to be 85 hours per year.[1145] Average hourly output of workers is estimated to be $60.77.[1146]

The total additional output due to forgone training time is therefore calculated as $1.9 billion per year when all workers are assumed to be affected, or $0.8 billion per year when only workers in high-use occupations are assumed to be affected.

Reduced Direct Outlays on Human Capital Investment

The second component of the economic effect calculated in the final analysis is reduced direct outlays on human capital investment—or the out-of-pocket cost to firms for training. The change in direct outlays on human capital investment resulting from the rule is calculated as follows:

*Reduced Direct Outlays = [(Total Direct Outlays)/(# of Workers Receiving Training)] * [(Total # of Affected Workers) * (Percentage Point Decrease in Trained Workers)]*

Total direct outlays on human capital investment are estimated to be $105 billion in 2023 dollars.[1147] The estimated number of workers receiving training is 23.5 million workers.[1148] The Commission estimates the total number of affected workers as 101.1 million workers, assuming all workers are affected, and 45.3 million workers, assuming only workers in high-use occupations are affected.[1149] The percentage point decrease in trained workers is estimated to be 0.4.[1150]

This calculation results in annual cost savings of $1.6 billion, assuming the training rates of workers in all occupations are affected and $0.7 billion assuming the training rates of workers only in high-use occupations are affected. The ten-year present value effects of the final rule on investment in human capital, assuming that lost investment is core investment, discounted at 2%, 3%, and 7% and separately assuming effects on workers in all occupations versus just workers in occupations that use non-competes at a high rate, are presented in the first two rows of Table 5.

ii. Estimates Assuming Lost Investment in Human Capital Is Advanced Training

The second set of estimates of the effects on human capital investment in the final analysis assumes all training is advanced. The Commission begins with the same approach (calculated in Part X.F.7.a.i) to estimate the direct gain in output of workers and reduced direct outlays from foregone advanced human capital investment because such investment is costly for firms and results in decreased time spent on productive activities by workers, regardless of whether the investment is core or advanced. The major difference is that the Commission nets out an additional component which represents lost long-term productivity of workers caused by lost investment in their human capital. The Commission nets out this additional component based on the assumption that advanced human capital investment results in some increased long-term productivity in workers (because it assumes that firms would not otherwise make such a costly investment). This results in estimated effects of the final rule that represent upper bounds on the costs associated with changes in investment in human capital. Therefore, the estimated effect of the rule on advanced human capital investment is calculated as follows:

Effect of Decreased Investment in Advanced Training = Additional Output of Workers Resulting from Less Time Spent Training + Reduced Direct Outlays on Training − Lost Output Resulting from Foregone Advanced Training

The first two components—additional output of workers due to less time spent training and reduced direct outlays on training—are calculated in Part X.F.7.a.i. The lost output of workers due to lost investment in their human

---

[1143] Excluding States which broadly prohibit non-competes (CA, ND, OK, and MN), the BLS reports employment of 126.4 million individuals in May 2022 (the most recent year with occupation-specific data available), 56.6 million of whom work in occupations that use non-competes at a high rate, as defined in Starr, *supra* note 445; see *https://www.bls.gov/oes/tables.htm*. The Commission estimates that 80% of employed individuals are covered by the Commission's jurisdiction (see Part X.F.4.a), resulting in 101.1 million covered workers, 45.3 million of whom work in high-use occupations. The Commission notes that these estimates include public employment, as data on occupation-specific employment at the State level are not available by firm ownership. Occupation-specific employment data are necessary to split workers into low- and high-use occupations. Workers including those estimated to be bound by non-competes and those who are not are included in this estimate, since the empirical estimate of the increase in training reflects a sample representative of the full workforce, not just those bound by non-competes.

[1144] The coefficient reported by Starr (*supra* note 445), 0.77%, corresponds to a one standard deviation increase on Starr's scale, and represents the percentage point effect on the percentage of workers trained (rather than the amount of training they receive). Rescaling to a scale of zero to one, a one standard deviation increase is equal to a change in the enforceability measure of 0.17. Since estimates for earnings and innovation use a mean enforceability change of 0.081 on a scale of zero to one, the coefficient in Starr is rescaled to 0.77 * (0.081/0.17) = 0.364%, which represents the change in the fraction of covered workers receiving training due to an average magnitude change of 0.081.

[1145] 85 hours per year is calculated as 5.7 weeks per year * 20.1 hours per week * 73.9%, where 73.9% is the percentage of training that is firm-sponsored (the type of training likely to be affected by the final rule). These three estimates (5.7 weeks per year, 20.1 hours per week, and 73.9% of training being firm sponsored) are estimated in Harley J. Frazis & James R. Spletzer, *Worker Training: What We've Learned from the NLSY79,* 128 Monthly Lab. Rev. 48 (2005).

[1146] The Commission assumes that the average hourly output of workers is twice their average earnings and estimates average earnings to be $30.38 per hour, which is the average hourly earnings for workers in training ages 22–64 currently holding one job in the Survey of Income and Program Participation for all waves from 1996 to 2008. The dollar value is adjusted to 2023 dollars.

[1147] 2022 Training Industry Report, Training Magazine (Nov. 2022) at 17.

[1148] Calculated as 15.8% * 148.9 million, where 15.8% is the percentage of workers who receive training, according to Frazis & Spletzer *supra* note 1145 at 48. 148.9 million is the estimated number of workers in the U.S. in May 2022 according to *https://www.bls.gov/oes/tables.htm*. Note that all workers are included in this estimate (not just workers in States which enforce non-competes) because the estimate of training expenditures also covers all workers.

[1149] Excluding States which broadly prohibit non-competes (CA, ND, OK, and MN), the BLS reports employment of 126.4 million individuals in May 2022 (the most recent year with occupation-specific data available), 56.6 million of whom work in occupations that use non-competes at a high rate, as defined in Starr (*supra* note 445) (*see https://www.bls.gov/oes/tables.htm*). The Commission estimates that 80% of employed individuals are covered by the Commission's jurisdiction (see Part X.F.4.a), resulting in 101.1 million covered workers, 45.3 million of whom work in high-use occupations. *See supra* note 1143.

[1150] As discussed in Part X.F.7.a.i.

capital due to the rule in each year is calculated as follows:

*Lost Output from Lost Investment in Human Capital = (Total # of Affected Workers) * (Percentage Point Decrease in Trained Workers) * (Average Hourly Output of Workers) * (Average Hours Worked per Year) * (% Productivity Loss)*

The Commission estimates the total number of affected workers as 101.1 million workers, assuming all workers are affected, and 45.3 million workers, assuming only workers in high-use occupations are affected.[1151] The percentage point decrease in trained workers is estimated to be 0.4.[1152] Average hourly output of workers is estimated to be $60.77.[1153] The average number of hours worked per year is 1,784.[1154] The Commission assumes the percent productivity loss to be 6.4%.[1155]

In the first year, this yields a total estimate of lost output from lost investment in human capital of $1.5 billion or $0.7 billion (under the separate assumptions of all workers being affected and only high-use occupation workers being affected). Since the returns to advanced training persist to some extent over time, in the second year, returns to advanced training from the first year are assumed to depreciate by 20%,[1156] and the calculation is redone according to the depreciated return to advanced training. In the third year, training from the first year again depreciates, and so on until the tenth year (the end of the horizon considered).

Additionally, in the second year, a new round of advanced training is forgone. An additional $1.5 billion or $0.7 billion in lost output is therefore incurred in the second year under the final rule, and the depreciation calculations are again repeated for the new round of advanced training until year ten. New rounds of advanced training are forgone in each year through the tenth. Lost output from lost advanced training in the tenth year is therefore the sum of a depreciated return to training from each of the prior nine years plus lost output from lost training in the tenth year itself.

To arrive at estimates of overall lost productivity due to lost advanced training, lost productivity in each year (separately due to lost training in each prior year) is added together. Finally, lost productivity due to lost advanced training is subtracted from the two components calculated in Part X.F.7.a.i (additional output of workers from less time spent training and reduced direct outlays). The ten-year discounted effects of the final rule on investment in human capital, assuming lost investment is advanced training investment, discounted at 2%, 3%, and 7%, and separately assuming workers in all occupations versus just workers in occupations that use non-competes at a high rate, are presented in the last two rows of Table 5.

TABLE 5

	2% Discount rate	3% Discount rate	7% Discount rate

Estimated discounted ten-year effect assuming lost training is core and workers in high-use occupations are affected	14	14	12
Estimated discounted ten-year effect assuming lost training is advanced and workers in all occupations are affected	−41	−39	−31
Estimated discounted ten-year effect assuming lost training is advanced and workers in high-use occupations are affected	−19	−17	−14

Note: All values in billions of 2023 dollars. Negative values represent net cost estimates, while positive values represent net benefit estimates.

As discussed in Part X.E, the Commission notes that the estimates in this Part X.F do not account for senior executives who continue to work under non-competes under the rule. If the effects on training are due to effects on such senior executives, then the effects discussed herein would occur further into the future than discussed.

b. Legal and Administrative Costs Related to Compliance

The Commission finds that firms with existing non-competes will have related legal and administrative compliance costs as a result of the final rule. The Commission quantifies and monetizes these costs and conducts related sensitivity analyses.

i. Legal Costs

The Commission finds one-time legal costs related to firms' compliance with the final rule are estimated to total $2.1-$3.7 billion. The Commission estimates two main components of legal costs: (1) updating existing employment agreements or terms to ensure new hire employment terms comply with the final rule; and (2) advising employers about potential operational or contractual changes for workers who will no longer have enforceable non-competes. The latter includes determination of workers whose non-competes are no longer enforceable

[1151] Excluding States which broadly prohibit non-competes (CA, ND, OK, and MN), the BLS reports employment of 126.4 million individuals in May, 2022 (the most recent year with occupation-specific data available), 56.6 million of whom work in occupations that use non-competes at a high rate, as defined in Starr (*Id.*) (see *https://www.bls.gov/oes/tables.htm*). The Commission estimates that 80% of employed individuals are covered by the Commission's jurisdiction (see Part X.F.4.a), resulting in 101.1 million covered workers, 45.3 million of whom work in high-use occupations. *See supra* note 1143.

[1152] As discussed in Part X.F.7.a.i.

[1153] The Commission assumes that the average hourly output of workers is twice their average earnings and estimates average earnings to be $30.38 per hour, which is the average hourly earnings for workers in training ages 22–64 currently holding one job in the Survey of Income and Program Participation for all waves from 1996 to 2008. The dollar value is adjusted to November 2023 dollars using *https://www.bls.gov/data/inflation_calculator.htm.*

[1154] See *https://fred.stlouisfed.org/release/tables?rid=50&eid=6462#snid=6449,* which reports average weekly hours and overtime of all employees on private nonfarm payrolls by industry sector, seasonally adjusted. The reported value, 34.3, is multiplied by 52 to get annual hours worked.

[1155] This figure is the midpoint of two estimates in the literature: Harley Frazis & Mark A. Loewenstein, *Reexamining the Returns to Training: Functional Form, Magnitude, and Interpretation,* 40 J. Hum. Res. 453 (2005) [3.7%] and Gueorgui Kambourov, Iourii Manovskii, & Miana Plesca, *Occupational Mobility and the Returns to Training,* 53 Can. J. of Econ. 174 (2020) [9.1%].

[1156] There is no perfect estimate of the rate of human capital depreciation in the economic literature. Studies typically make assumptions they deem reasonable to estimate this rate, with 20% representing neither the low end nor the high end of the range of such assumptions. *See, e.g.,* Rita Almeida & Pedro Carneiro, *The Return to Firm Investments in Human Capital,* 16 Lab. Econs. 97 (2009), who assume that the human capital depreciation rate may range from 5% to 100%.

under the rule, as opposed to those that fall under the exemption for senior executives.

For the first component, firms must consider what changes to their contractual practices are needed to ensure that incoming workers are not offered or subject to non-competes and what revisions to human resources materials and manuals are needed to ensure they are not misused on a forward-going basis. Firms may respond by removing specific non-compete language from standard contracts and human resources (H.R.) materials and manuals used for future employees. The second component involves strategic decisions and changes in response to the final rule. For example, firms may adjust other contractual provisions such as NDAs. This legal work is not mandated or required by the rule; it would be undertaken only by the subset of firms and workers for whom firms conclude that such alternatives would be desirable. Additionally, such adjustments are likely unnecessary for senior executives whose non-competes continue to be enforceable under the rule. Therefore, this component additionally involves identifying senior executives whose existing non-competes are unaffected. For any such legal work, firms may use in-house counsel or outside counsel.

Legal costs are therefore calculated as follows:

Legal Costs = Modify Standard Contract Language/H.R. Materials and Manuals Costs + Revise Contractual Practices Costs

One component of the legal cost will be due to the modification of standard contracts to remove prohibited language regarding non-competes which is calculated as follows:

*Modify Standard Contract Language/H.R. Materials and Manuals = (Average Hours Necessary for Modification) * (Cost per Hour) * (# of Affected Businesses)*

The Commission estimates that, on average, modifying standard contract language and H.R. materials and manuals would take the equivalent of one hour of a lawyer's time.[1157] The estimated cost per hour is $134.62 in 2023 dollars,[1158] and the number of affected businesses is 3.4 million.[1159] This results in a total one-time modification cost of $457 million.

Another component of legal costs relates to any firm-level revision to their contractual practices, including identification of senior executives, which is calculated as follows:

*Revise Contractual Practices Costs = (Average Hours Necessary to Update Contractual Practices) * (Cost per Hour) * (# of Affected Businesses)*

The Commission estimates the average firm employs the equivalent of four to eight hours of a lawyer's time to update its contractual practices and determine which employees may fall under the final rule's exemption.[1160] The Commission estimates the cost of a lawyer's time to be $134.62 as discussed in this Part X.F.7.b.i. The number of affected businesses is estimated to be 2.9 million.[1161]

Under the assumption that the average firm that uses a non-compete employs the equivalent of four to eight hours of a lawyer's time, the total one-time expenditure on revising contractual practices would range from $1.6 billion (assuming four hours are necessary) to $3.1 billion (assuming eight hours are necessary).

Some commenters indicated that some firms may use outside counsel, which is more costly to firms, to remove non-competes from contracts of incoming workers and to update contractual practices. While commenters did not provide data to support this assertion, as a sensitivity analysis, the Commission replaces the estimate of the hourly earnings of a lawyer with an estimate of the cost of outside counsel ($483 per hour), conservatively overestimating costs by using the estimated rate of a tenth-year lawyer.[1162] Under this sensitivity analysis, the Commission estimates the total cost of ensuring that incoming workers' contracts do not contain non-competes would be $1.6 billion and the cost of updating contractual practices would be $5.6-$11.3 billion. Some commenters stated that the hourly cost of lawyers' time may be even greater than the value assumed in the sensitivity analysis ($483 per hour). The Commission finds that the sensitivity analysis assuming a rate of $438 per hour provides a reasonable estimate of the costs under the assumption that outside counsel would be used, and that higher rates (*e.g.,* $749 per hour, as stated by one commenter) are unreasonably high, especially as an average across many firms.

The Commission believes the exclusion of existing non-competes with senior executives could result in lower net legal costs than the Commission's estimate. First, for senior executives who currently work under a non-compete, firms will have a longer time period during which they may update

---

[1157] This process would likely be straightforward for most firms (*i.e.,* simply not using non-competes or removing one section from a boilerplate contract). There may be firms for which it is more difficult and requires more time. This analysis uses an average time spent of one hour, which conservatively represents the *average* time spent to do so, and accounts for variation across firms.

[1158] According to BLS, the median wage for a lawyer was $65.26 per hour in 2022, or $67.31 in 2023 dollars. See *https://www.bls.gov/ooh/legal/lawyers.htm.* As in Part X.F.7.a, the Commission doubles this number to reflect the lost productivity of the worker.

[1159] Calculated as 6.88 million * 0.494. Here, 6.88 million is the number of establishments in the U.S. (excluding California, North Dakota, Oklahoma, and Minnesota, where non-competes are broadly unenforceable) in 2021 (the most recent year with data available): see *https://www.census.gov/data/tables/2021/econ/susb/2021-susb-annual.html.* This value is multiplied by 49.4%, the percentage of firms using non-competes in the U.S. according to Colvin & Shierholz (*supra* note 65).

[1160] The Commission emphasizes that this is an average to underscore there would likely be large differences in the extent to which firms update their contractual practices. Many firms, including those that use non-competes only with workers who do not have access to sensitive information, or those which are already using other types of restrictive employment provisions to protect sensitive information, may opt to do nothing. There is evidence indicating firms that use non-competes are already using other types of restrictive employment provisions: Balasubramanian et al. (2024) find that 95.6% of workers with non-competes are also subject to an NDA, 97.5% of workers with non-competes are also subject to a non-solicitation agreement, NDA, or a non-recruitment agreement, and that 74.7% of workers with non-competes are also subject to all three other types of provisions. See Balasubramanian, Starr, & Yamaguchi (*supra* note 74). Other firms may employ several hours or multiple days of lawyers' time to arrive at a new contract. The estimated range of four to eight hours represents an average taken across these different possibilities. For example, if two-thirds of firms that currently use non-competes opt to make no changes to their contractual practices (for example, because they are one of the 97.5% of firms which already implement other post-employment restrictions, or because they will rely on trade secret law in the future, or because they are using non-competes with workers who do not have access to sensitive information), and one-third of such firms spend (on average) the equivalent of 1.5 to 3 days of an attorney's time, this would result in the estimate of 4–8 hours on average.

[1161] Calculated as 5.91 million * 0.494. Here, 5.91 million is the number of firms in the U.S. (excluding California, North Dakota, Oklahoma, and Minnesota, where non-competes are broadly unenforceable) in 2021 (the most recent year with data available): *see https://www.census.gov/data/tables/2021/econ/susb/2021-susb-annual.html.* This value is multiplied by 49.4%, the percentage of firms using non-competes in the U.S. according to Colvin & Shierholz (*supra* note 65). The Commission notes that this analysis assumes that decisions regarding protection of sensitive information and contract updating are made at the firm (a collection of establishments under shared ownership and operational control), rather than establishment, level, since sensitive information is likely shared across business establishments of a firm. This explains the difference between the number of businesses used here (2.9 million) versus the number used to calculate the cost of contract revision (3.4 million).

[1162] This estimate is drawn from the Fitzpatrick Matrix. *See supra* note 1087 and accompanying text. Note that the Commission does not double this number to reflect productivity, since the cost of outside counsel's time likely already reflects the productivity of that worker.

contractual practices. For example, for a senior executive who does not change jobs for 5 years after the compliance date of the final rule, the firm will have 5 years to determine how it wants to update contractual practices for an incoming senior executive who replaces the current one. Delaying costs in this way reduces their economic effect due to discounting. Additionally, if a senior executive remains in their job for over ten years, then the cost of updating contractual practices would fall outside the scope of the Commission's estimates altogether.

At the same time, when the final rule goes into effect, firms will need to identify senior executives whose existing non-competes are not covered by the final rule in order to determine which contractual practices they may need to update immediately. The Commission does not include a separate legal cost for identifying senior executives and estimates the range of attorney time for revising contractual practices under the final rule, which encompasses identifying senior executives, to be the same as the estimate for the proposed rule—4 to 8 hours. This is in part because the strategic considerations involved in revision of contractual practices will likely include such identification. Moreover, the Commission believes the identification of such workers will not be difficult or time consuming. Firms can use the compensation threshold to rule out the vast majority of workers from the exemption and the definition of senior executive in § 910.1 includes clear duties to determine whether any executives who meet the compensation threshold are senior executives under the final rule. It also provides that the CEO and/or president of a firm is a senior executive without the need to conduct any duties analysis.

Another reason the Commission does not add to its estimate of 4 to 8 hours to account for identification of senior executives is that excluding existing non-competes with senior executives would otherwise decrease this estimate, likely to a greater degree than the cost of identifying senior executives. As noted, a significant amount of time spent by attorneys as estimated in the NPRM was intended to account for revising contractual practices for more complex agreements. Commenters noted that employment terms with senior executives are often individualized so that attorney and firm time would be spent on their agreements regardless of whether a non-compete may be included. Since firms use non-competes for senior executives at a high rate,[1163] revising contractual practices for senior executives may constitute a significant portion of the overall estimate of the cost of revising contractual practices, and given their exclusion, the Commission finds that the cost estimate for revising contractual practices likely represents an overestimate overall. The Commission does not, however, reduce its final cost estimates to account for this change. As noted in Part X.D, this final analysis generally does not account for the temporal difference in coverage of non-competes for senior executives. The same is true here and, to be consistent across the estimates in this final regulatory analysis, the Commission does not estimate a reduction in legal cost but notes potential bases for differences in estimates where relevant.

Overall, the Commission acknowledges that there may be substantial heterogeneity in the costs for individual firms; however, these numbers may be overestimates. For firms whose costs of removing non-competes for incoming workers is greater, the work of ensuring that contracts comply with the law would overlap substantially with the costs of updating contractual practices.

ii. Administrative Costs for Notification Requirement

The Commission finds the total one-time costs for implementing the notification requirement are estimated to be $94 million. These costs relate to the provision of notice to workers other than senior executives as required by § 910.2(b). Notably, firms may use the model notice language provided by the Commission, and the form of this model notice enables firms to choose to send the notice to workers regardless of whether they have non-competes as described in Part IV.E. The notice provision cost is calculated as follows:

Notice Provision Cost = Digital Notice Provision Costs + Mailed Notice Provision Costs

The first component, digital notice provision costs, are calculated as follows:

*Digital Notice Provision Costs = (Average Hours Necessary to Compose and Send Notice) * (Cost per Hour) * (# of Affected Businesses)*

The Commission estimates that 20 minutes (⅓ of one hour) are necessary for a human resources specialist to compose and send this notice in a digital format to all of a firm's workers who are not senior executives [1164] and applicable former workers, on average.[1165] The cost per hour is estimated to be $63.70.[1166] The estimated number of affected businesses is 3.4 million.[1167] The digital notice provision cost is therefore estimated to be $72 million.

Businesses may not have digital contact information for some workers. The cost of mailed notice provision would include the cost of postage and the cost of a human resource professional's time. Mailed notice provision costs are therefore calculated as follows:

*Cost of Mailed Notice Provision = Number of Workers with Non-competes Receiving Physical Notice * (Cost of One Printed Page + Mailing Cost + Cost of Human Resource Professional's Time)*

The number of workers with non-competes receiving physical notice is the total number of covered workers (101.1 million; see Part X.F.7.a.i) times the percentage of workers who have non-competes (18.1%) times the percentage of workers who require mailed notice (assumed to be 66% of workers [1168]), for a total of 12.3 million workers. The Commission notes that the percentage of workers who require mailed notice is likely a substantial overestimate, since it is estimated based on the percentage of individuals who receive health information digitally. The Commission believes employers are more likely to have digital means of providing the notice to their current workers especially, but also to their

[1163] More than 60%; *see* Part I.B.2.

[1164] The Commission notes that identification of such workers is accounted for in revision of contract costs calculated in Part X.F.7.b.i.

[1165] *See, e.g.,* the supporting statement for the Notice of Rescission of Coverage and Disclosure Requirements for Patient Protection under the Affordable Care Act (CMS–10330/OMB Control No. 0938–1094) at 5, which estimates time spent customizing and sending similar notice. Available at *https://www.reginfo.gov/public/do/DownloadDocument?objectID=119319401.*

[1166] According to BLS, the median wage for a human resources specialist was $30.88 per hour in 2022, which is equivalent to $31.85 in November 2023 dollars, updated for inflation using *https://www.bls.gov/data/inflation_calculator.htm.* See *https://www.bls.gov/ooh/business-and-financial/human-resources-specialists.htm.* As in Part X.F.7.a, the Commission doubles this number to reflect the lost productivity of the worker.

[1167] As calculated in Part X.F.7.b.i., the Commission conservatively assumes that each establishment—a physical location of a business—must engage in its own communication, and that each establishment has digital contact information for at least one worker, and will therefore engage in digital notice provision.

[1168] See *infra* note 1165 (CMS Supporting Statement assumes 66% of workers require mailed notice from their health insurance companies).

former workers. The Commission adopts this estimate as an upper bound.

The cost per worker is estimated as 5 cents for one printed page plus mailing cost of 70 cents plus one minute of an HR professional's time, at $63.70 per hour, for a total of $1.81 per notice. The overall cost of mailed notice provision is therefore estimated to be $22 million. The total cost of the notice provision is therefore $94 million.

Commenters stated that it may take two hours of a legal professional's time to provide notice. The Commission finds this estimated time to be a substantial overestimate and reiterates that this analysis incorporates a legal professional's time necessary to identify senior executives and to strategize updates to firm contractual practices into its estimate of legal costs in X.F.7.b.i. The model notice language alleviates the need for a legal professional's time and the Commission finds it unreasonable to assume such a notice would need to actually be sent by a legal professional. While firms may opt to use original language drafted by an attorney to notify workers, the Commission notes that the model language satisfies the notification requirement and therefore does not include the cost of original language as a regulatory cost estimate in the final analysis. However, under these assumptions, the cost of providing the notice is estimated at $5.2 billion.

The Commission notes that communication is conducted at the establishment level and time costs do not vary based on the number of existing senior executives with non-competes that the final rule does not cover. While establishments with only senior executives with non-competes would not incur any notification costs because the final rule does not cover existing non-competes with senior executives, without an estimate of the percentage of firms for which this is true, the Commission conservatively assumes that all establishments estimated to use non-competes engage in this notification.

Legal and administrative costs are summarized in Table 6. The Commission notes that, since all costs are assumed to be borne in the first year, there is no discounting applied and therefore only one estimate for each analysis is presented.

TABLE 6

c. Litigation Effects

Theoretically, under the final rule, certain litigation costs may fall. Litigation related to non-competes may decrease because the final rule creates bright line rules, reducing uncertainty about the enforceability of non-competes. On the other hand, litigation costs may rise if firms turn to litigation to protect trade secrets and if that litigation is more expensive than enforcing (or threatening to enforce) non-competes, and/or if firms elect to litigate over what constitutes a non-compete.

The Commission finds there are plausible but directionally opposite theoretical outcomes for the different types of litigation that may be affected by the final rule. In fact, some recent evidence suggests trade secret litigation falls as a result of bans on non-competes taking effect.[1169] The Commission finds no evidence increased litigation will result in increased costs associated with the final rule. The Commission cannot quantify or monetize the overall effect as a cost or benefit, but estimates the magnitude of any change would be sufficiently small as to be immaterial to the Commission's assessment of whether the benefits of the rule justify its costs.

8. Transfers

As discussed in Part X.F.6.a, some portion of the earnings effect associated with the final rule represents a transfer: while workers may earn more with greater productivity resulting from the rule, some of their earnings increase may result from enhanced bargaining power, which constitutes a transfer from firms to workers.

Similarly, some portion of the price effects associated with the final rule represents a transfer: while consumers may achieve greater surplus with increased competition, the price decrease itself is partially a transfer from firms to consumers.

9. Distributional Effects

The Commission finds several distributional effects associated with the final rule, including those associated with firm expansion and formation, distributional effects on workers, and labor mobility, as summarized in Table 1 in Part X.E.

a. Firm Expansion and Formation

When non-competes are prohibited, new firms may enter the market but incumbent firms may opt to invest less in capital, leaving the overall effect on total capital investment unclear. Similarly, while new firms may enter the market, it is theoretically possible that incumbent firms may exit the market without the ability to use non-competes (though no evidence of this

[1169] Greenwood, Kobayashi, & Starr, *supra* note 757. The Commission notes that this study supplements—but is not necessary to support—its finding that no evidence supports the conclusion that litigation costs will increase under the final rule. That finding is based on the Commission's expertise and the rulemaking record, including relevant comments. This study was published after the close of the comment period.

effect exists) or contract. Research finds that decreased non-compete enforceability increases new firm formation by 2.7% and may have no effect on capital investment or may decrease capital investment at incumbent firms by up to 7.9%. To the extent there may be a decrease in capital investment at incumbent firms as a result of the final rule, it may represent a shift in productive capacity from incumbent firms to new firms. As discussed in Part IV.D, another purported justification for non-competes is that they allow firms to protect trade secrets, which in theory might allow firms to share those trade secrets more freely with workers, and so improve productivity. However, no empirical evidence substantiates this claim or would allow quantification or monetization of this effect.

Empirical evidence has studied parts, but not all, of the contrasting effects on capital investment and new firm formation. Studies have examined effects of non-competes on capital investment by large, publicly traded firms, who are likely incumbents.[1170] However, no study examines the effect of capital investment economy-wide, nor does any study specifically examine capital investment for new firms. Similarly, studies have examined new firm formation, but no studies look at firm exit among incumbents.

It is thus not possible to measure the benefit and costs of the full economy-wide effects on firm expansion and formation. The calculations that may be performed using available data will necessarily omit components of the tradeoff. The final analysis therefore quantifies the effects that the literature has examined but does not monetize those effects.

i. Capital Investment

Research finds that capital investment for incumbent firms at the firm level may decrease under the final rule for the economy as a whole, though effects for high-tech industries may be positive, negative, or close to zero. The Commission notes that the capital investment discussed in this Part X.F.9 relates to tangible capital, does not reflect capital investment by newly-formed firms, and is distinct from R&D spending, which is discussed in Part X.F.6.b.

One estimate of the overall effect of non-compete enforceability on capital investment by incumbent firms, which some commenters pointed to, is estimated with substantial uncertainty and is statistically indistinguishable from zero (*i.e.,* statistically insignificant): a decline in capital investment of 7.9% for the average incumbent publicly-traded firm.[1171] Another study finds no effect on capital investment, but includes the use of non-competes in its estimating procedure, leading to concerns that the finding does not support a causal interpretation, as explained in Part IV.A.2.[1172]

The Commission notes two additional estimates specific to high-tech or knowledge firms: a decline in capital investment among incumbent publicly-traded firms of 34%–39% (an estimate which corresponds to the estimate of a decline of 7.9% when all publicly traded firms are examined),[1173] and an increase in capital investment of 3.1% for the average publicly-traded high-tech firm (an estimate that is statistically insignificant).[1174] The Commission notes the study finding an increase in capital investment of 3.1% uses a more granular measure of non-compete enforceability than the study finding a decrease of 34%–39%, and the Commission therefore gives it more weight.[1175]

The Commission reiterates that any change in investment at the firm level does not necessarily mean investment would change at the market level, since increased firm entry may also increase the employed capital stock and investment in that capital stock, which may offset any possible decreases in investment for incumbent firms. These potential positive offsetting effects are not captured in the estimates herein.

ii. New Firm Formation

Research finds that new firm formation increases by 2.7% across the economy due to decreases in non-compete enforceability.[1176] The Commission also notes an estimate specific to high-tech industries: that decreases in non-compete enforceability led to a 3.2% increase in the establishment entry rate.[1177]

The benefits associated with new firm entry may include added surplus for consumers (*e.g.,* from increased competition) or workers (from expanded labor demand). However, the Commission is unable to quantify those beneficial effects, though some may be captured by the effect on prices discussed in Part X.F.6.c. Nor is it able to quantify whether existing firms might exit or contract in response to this new firm entry (*i.e.,* whether the new firms' output would be wholly additive or crowd out some amount of existing firms' output). New firm entry may also drive some of the innovative effects of the final rule if new firms are engaging in substantial innovation.

Overall, the Commission finds that the rule will likely result in a 2.7% increase in new firm formation and is unable to quantify the net effects of this on the productive capacity of the economy. Benefits from new firm entry and possible costs from decreased capital investment may offset each other but the degree to which this happens is not quantifiable. The effect of the final rule on firm expansion and formation likely results in productive capacity shifting from incumbent firms to new firms. Consistent with findings in Part IV.B.3.b.iii, productive capacity shifting from incumbent to new firms may decrease concentration, possibly contributing to decreases in prices, as discussed in Part X.F.6.c.

[1170] Jeffers, *supra* note 450; Johnson, Lipsitz, & Pei, *supra* note 526.

[1171] The increase, 7.9%, is calculated as 0.00317/0.04, where 0.00317 is the reported coefficient (Table 4, Panel A, Column 1), and 0.04 is the mean investment per million dollars of assets ratio, across all firms (Table 2, Panel C). Due to statistical uncertainty, the estimate cannot rule out (with 95% confidence) values ranging from a *gain* in capital investment equal to 6.7% to a *loss* in capital investment equal to 22.5% for the average firm. See Jeffers, *supra* note 450.

[1172] Shi, *supra* note 84.

[1173] Jeffers, *supra* note 450. The estimate pertains to firms in Technology and Professional, Scientific, and Technical Services.

[1174] Johnson, Lipsitz, & Pei, *supra* note 526. The estimate pertains to firms classified as high-technology by the National Science Foundation: see *https://nsf.gov/statistics/seind14/index.cfm/chapter-8/tt08-a.htm.*

[1175] The two studies are otherwise identical in the extent to which they satisfy the criteria for assessing empirical research laid out in Part IV.A.2.

[1176] Jeffers (*supra* note 450) does not report an effect for the economy as a whole. However, Jeffers reports coefficients of −0.103 for the effect of increased non-compete enforceability on firms founded per million people in knowledge-sector industries and 0.008 for non-knowledge sector industries, with respective sample sizes of 78,273 and 190,665 (Table 9, Panel A, Columns 1 and 2). Using the sample sizes as weights, the Commission estimates a weighted average of these coefficients of −0.024. Applying this estimate to the average number of firms founded per million people (Table 2, Panel B) results in an estimated increase in new firm formation of 2.7%. The Commission did not calculate the effect for the economy as a whole in the NPRM. The NPRM reported that increases in non-compete enforceability decreased new firm entry by ''0.06 firms per million people (against a mean of 0.38) for firms in the knowledge sector,'' NPRM at 3526, which was consistent with the version of the Jeffers study cited in the NPRM. The final rule cites the updated version of the Jeffers study, published in 2024. The Commission notes that estimation of the uncertainty in the combined estimate requires information on the covariance of the estimated coefficients, which is not reported in Jeffers' study. See Jeffers, *supra* note 450.

[1177] Johnson, Lipsitz, & Pei, *supra* note 526. The estimate pertains to firms classified as high-technology by the National Science Foundation: see *https://nsf.gov/statistics/seind14/index.cfm/chapter-8/tt08-a.htm.*

b. Distributional Effects on Workers

The Commission finds that the final rule may reduce gender and racial earnings gaps, may especially encourage entrepreneurship among women, and may mitigate legal uncertainty for workers, especially relatively low-paid workers.

Specifically, the Commission finds gender and racial wage gaps may close significantly under a nationwide prohibition on non-competes, according to economic estimates.[1178] Another estimate indicates that the negative effect of non-compete enforceability on within-industry entrepreneurship is significantly greater for women than for men.[1179]

The Commission finds the rule may be especially helpful for relatively low-paid workers, for whom access to legal services may be prohibitively expensive. Workers generally may not be willing to file lawsuits against deep-pocketed employers to challenge their non-competes, even if they predict a high probability of success. The Commission finds that the bright-line prohibition in the final rule, which the Commission could enforce, may mitigate uncertainty for workers.[1180]

c. Labor Mobility

The Commission finds the overall effect of the final rule on turnover costs due to increased labor mobility is ambiguous and represents a distributional effect of the rule. The Commission finds turnover costs for firms seeking new workers may fall with a greater availability of experienced labor. For firms losing workers newly freed from non-competes, the Commission estimates the effect of the final rule to be $131 per worker with a non-compete. The Commission therefore finds the effect on turnover costs represents a distributional effect of the final rule because it costs firms that use non-competes to constrain workers and benefits firms that do not.

To calculate the potential $131 increase in turnover costs for workers whose non-competes are no longer enforceable after the rule, this final analysis calculates:

*Additional Turnover Cost per Worker with a Non-compete = (Baseline Turnover Rate) * (% Increase in Turnover) * (Rate of Use of Non-competes in Affected Industries) * (Overall Earnings of Affected Workers) * (Cost of Turnover as % of Earnings)/(Number of Workers in Affected Industries with Non-competes)*

The Commission estimates the baseline turnover rate, *i.e.,* the turnover rate in the status quo, to be 47% annually.[1181] The estimated percent increase in turnover from the final rule is 1.0%.[1182] The estimated rate of use of non-competes in affected industries is 23.9%.[1183] Estimated overall earnings of affected workers is $5.25 trillion.[1184] The estimated cost of turnover as a percentage of earnings is 25%.[1185] Finally, the estimated number of workers in affected industries with non-competes is 11.8 million.[1186]

The annual estimated increase in turnover costs per worker with a non-compete is $131.

The Commission notes the actual costs of turnover to businesses may be substantially lower under the final rule than this estimate reflects. This is because the specific components of turnover costs—finding a replacement, training, and productivity—are likely to be affected by the final rule. An increased availability of experienced workers results when non-competes no longer constrain those workers, and finding replacements will be less costly to firms. Additionally, training should not be counted in the costs of turnover presented in this Part X.F.9.c, since it is separately accounted for in Part X.F.7.a, but is nevertheless included in the 25% estimate used to arrive at the estimate of $131 per worker with a non-compete, since there is no reliable way to remove training costs from that estimate; it is thus double-counted. Finally, because the Commission finds increased labor mobility will likely increase worker productivity due to better matching between workers and firms, the cost of lost productivity will be lower. The cost of lost productivity will also be lessened because the pool of workers available to firms may be more talented or experienced, since such workers would no longer be bound by non-competes (relative to new entrants to the workforce, who are not experienced and also are not bound by non-competes). This would allow firms to recruit workers who are more likely to be highly productive upon entry at a new job.

The Commission reiterates its finding that the costs of turnover for many firms may diminish due to a more plentiful supply of available labor. Without estimates of the effect of the final rule on the cost of recruiting a worker, the net effect of the final rule on turnover costs is not quantified.

10. Break-Even Analysis

The Commission believes it has quantified the effects of the final rule that are likely to be the most significant in magnitude, but data limitations make it challenging to monetize all the expected effects of the final rule, *i.e.,* to numerically estimate the impact of particular effects on the economy as a whole. Most of the estimated costs of the final rule are monetized in Part X.F.7. However, the Commission is unable to monetize the estimated benefits of the final rule without additional assumptions. Two of the major benefits—innovation and earnings—are quantified but they are not monetized because a particular parameter or data point that would allow the Commission to estimate their effect in dollars is unavailable. For earnings, this parameter is an estimate of the percentage of the effect on earnings that represents a benefit versus a transfer.[1187] For innovation, this parameter is an estimate of the social value of a patent. Making an assumption about these parameters allows the Commission to monetize the benefits associated with the effect on earnings and innovation. A break-even analysis based on such assumptions confirms the Commission's finding that the benefits of the rule clearly justify the costs.

The analysis in this Part X.F.10 calculates the sum of the monetizable costs of the rule, separately under the assumption that lost investment in human capital is core training (in which case monetizable costs are direct

[1178] Johnson, Lavetti, & Lipsitz, *supra* note 388 at 38.

[1180] NPRM at 3531.

[1181] Based on annual worker mobility rates (separations divided by employment) in 2022 as calculated using the Job Openings and Labor Turnover Survey, conducted by BLS.

[1182] Calculated as $-e((-0.241+0.112)*0.081) - 1)$, where $-0.241+0.112$ represents the estimated effect in Johnson, Lavetti, and Lipsitz (*supra* note 388) on workers in high use industries. The corresponding estimate for other industries is statistically indistinguishable from zero and those industries are therefore omitted from calculations. The multiplier 0.081 is the average magnitude change in non-compete enforceability, as discussed in Part X.F.5.

[1183] Calculated as the average usage rate in high-use industries in Starr, Prescott & Bishara (*supra* note 68).

[1184] Based on data from BLS for industries classified as high-use in Starr, Prescott & Bishara (*supra* note 68), excluding CA, ND, OK, and MN. See *https://data.bls.gov/cew/apps/data_views/data_views.htm#tab=Tables.*

[1185] See Pivateau, *supra* note 1090.

[1186] Calculated as 49.4 million * 23.9%. 49.4 million is equal to 0.8 * 61.8 million, where 0.8 is the coverage rate (see Part X.F.4.a) and 61.8 million is the number of workers in high-use industries (*https://data.bls.gov/cew/apps/data_views/data_views.htm#tab=Tables*). 23.9% is the average usage rate in high-use industries in Starr, Prescott, & Bishara (*supra* note 68).

[1187] Though the estimated effect on earnings is presented in dollars, the Commission considers this value to be quantified, but not monetized, since some part of the estimate may represent a transfer and not a benefit.

compliance costs and the cost of updating contractual practices), and under the assumption that lost investment in human capital is advanced training (in which case monetizable costs are the net cost of lost productivity from decreased human capital investment, direct compliance costs, and the cost of updating contractual practices). The analysis conservatively assumes that training for all workers is affected (versus just those in high-use occupations, as described in Part X.F.7.a).

If the Commission assumes the decrease in human capital investment is a decrease in core training, the final rule results in net benefits without monetizing or counting any positive effects on the economy from earnings or innovation. The savings or benefit to the economy from reduced core training would be greater than the combined monetized costs of the final rule in X.F.7.b. In other words, even if the benefit to the economy from earnings and innovation were assumed to be zero (an implausible and extremely conservative assumption), the final rule would be net beneficial under the assumption that estimates of reduced training reflect better matching of workers and firms and therefore a reduced need to provide workers with core training.

Under the assumption that lost human capital investment is advanced, the Commission calculates values of the social value of a patent and the benefit percentage of the earnings effect that would fully offset the net monetizable costs of the final rule.

a. Estimate of Net Benefit Assuming Lost Human Capital Investment Is Core Training

Under the assumption that lost human capital investment is core, the sum of the present discounted value of direct compliance costs and the cost of contractual updating (the monetizable costs of the rule), using a 3% discount rate, is $3.7 billion. In this case, the final rule is net beneficial even ignoring the benefits associated with innovation and earnings. This is because the net monetized cost ($3.7 billion) is less than the monetized benefit associated with investment in human capital ($31 billion or $13.9 billion, when all occupations are assumed to be affected versus just high-use occupations, respectively). The net monetizable benefit of the final rule—even ignoring benefits associated with innovation and earnings—is therefore $27.3 billion or $10.2 billion, respectively.

b. Estimate of Net Benefit Assuming Lost Human Capital Investment Is Advanced Training

In this Part X.F.10.b, the Commission calculates the net monetizable costs and benefits of the final rule assuming that lost human capital investment is advanced training, and under varying assumptions about the values of the two monetization parameters identified (the social value of a patent and the percentage of the earnings effect that represents a benefit). Then, the Commission calculates break-even points: values for the monetization parameters which would fully offset the net monetizable costs of the final rule.

Break even points are calculated by finding the values of the social value of a patent and the benefit percent of the earnings increase such that:

*(Net Costs Associated with Investment in Human Capital) + (Direct Compliance Costs) + (Costs of Updating Contracts) = (Earnings Increase) * (Benefit % of Earnings Increase) + (Patent Increase) * (Social Value of Patent)*

As calculated in Part X.F.7, assuming a 3% discount rate, the net cost associated with investment in human capital is $39.0 billion.[1188] Direct compliance costs plus the cost of updating contracts are estimated to be $3.7 billion.[1189] Net monetizable costs therefore total $42.7 billion.

The estimated earnings increase of the final rule over ten years, discounted at 3% is $468 billion. The estimated effect of the rule on innovation (using the low end of the primary estimate) ranges from an additional 3,111 patents per year to 31,110 patents per year, increasing as time goes on.[1190]

The Commission presents estimates that demonstrate break-even points by making an assumption for the value of one of the two monetization parameters, and calculating the value of the other which implies equal monetized costs and benefits. Based on estimates of the private value of a patent, the Commission separately assumes that the social value of a patent is $94,886, $234,399, $5,865,833, or $32,459,680.[1191] In addition to spanning a wide range of possible valuations, these values all represent the private value of a patent to certain actors (*e.g.,* the purchaser or seller of a patent, or shareholders of a patenting company). These values do not account for innovative spillovers (*e.g.,* follow-on innovation) or product market spillovers to competitors (who may lose business to innovating firms), and therefore do not necessarily represent the social value of a patent. However, they serve as benchmarks against which to assess the breakeven points of the analysis of the final rule.

No studies have assessed what percentage of the earnings effect of non-compete enforceability is a benefit versus a transfer. The Commission separately assumes that the percentage is equal to 0%, 5%, 10%, and 25%.

The computed breakeven points are reported in Table 7, under the assumption that lost investment in human capital is advanced. Panel A reports necessary benefit percentages, under each of the four assumed social values of a patent, that would cause the rule to result in zero net monetized benefit. A reported value of 0% indicates that the assumed value of a patent itself covers the net monetized costs of the final rule. Panel B reports the necessary social value of a patent, under each of the four assumed benefit percentages, that would cause the rule to result in zero net monetized benefit. A reported value of $0 indicates that the benefits associated with earnings cover the net monetized costs of the final rule on their own.

TABLE 7

Assumed social value of a patent	Necessary benefit percentage on earnings
Panel A	
$94,886	5.5
$234,399	1.7
$5,865,833	0.0

[1188] Note that this calculation considers the net cost of lost investment in human capital (*i.e.,* the cost of lost productivity, minus the savings on direct outlays and gained output due to less time spent training). The Commission reiterates that this calculation assumes that lost human capital investment is advanced, rather than core.

[1189] This calculation assumes that updating contractual practices takes, on average, eight hours per firm.

[1190] The estimates presented here conservatively assume zero effect on R&D spending.

[1191] The Commission points out that the economic literature has not explored the *social* value of a patent, but has explored the *private* value of a patent, with highly varied conclusions (all reported here adjusted to 2023 dollars). Serrano estimates the average value of a patent (in terms of its sale price at auction) to be between $234,399 and $289,022. Pakes estimates the average value of a patent (in terms of stock market reactions to announcements) to be $5,865,833. Kogan et al. estimate the average value of a patent (also in terms of stock market reactions to announcements) to be $32,459,680. Outside of the academic literature, a Richardson Oliver Insights report notes that the average sale price of U.S. issued patents on a brokered market was $94,886. *See* Carlos J. Serrano, *Estimating the Gains from Trade in the Market for Patent Rights,* 59 Int'l Econ. Rev. 1877 (2018); Pakes, *supra* note 1132; Kogan, et al., *supra* note 1131; Richardson Oliver Insights Report (2022): *https://www.roipatents.com/secondary-market-report.*

TABLE 7—Continued

Assumed social value of a patent	Necessary benefit percentage on earnings
$32,459,680	0.0
Assumed benefit percentage on earnings	**Necessary patent value**
Panel B	
0%	$297,144
5%	134,202
10%	0
25%	0

Panel A shows that, even assuming a value of patenting ($94,886) that is substantially lower than the estimates in the economic literature, only 5.5% of the earnings effect must be an economic benefit (as opposed to a transfer) for the benefits associated with innovation and earnings to outweigh the monetized costs of the rule. Panel B shows that, even if no part of the earnings effect of the final rule reflects an economic benefit (which the Commission finds to be unlikely, in light of the evidence discussed in Part IV.B.3.a.ii), the social value of a patent would need to be only $297,144 in order to cover the monetized costs of the rule—well within the range of (private) values of a patent found in the literature.

The Commission additionally notes that Table 7 omits other benefits of the rule. The estimated benefits do not include the benefits arising from decreased consumer prices or increased workforce output. The estimates also omit possible changes in litigation costs associated with the rule. The Commission finds it likely that the omitted benefits substantially exceed the omitted costs, and additionally reiterates that the estimated values in Table 7 assume that lost investment in human capital is fully advanced. Therefore, the Commission views the values reported in Table 7 as conservative estimates of the breakeven points of the rule under those scenarios.

11. Analysis of Alternative Related to Senior Executives

The Commission elects to provide an analysis of the effects of an alternative with more limited coverage. Specifically, the Commission provides an analysis of a rule that would cover—and therefore ban—non-competes with all workers except senior executives. As compared to the final rule, under this alternative, it would not be an unfair method of competition to enter into non-competes with senior executives after the effective date. The Commission finds that excluding all non-competes with senior executives from coverage under the rule (as opposed to the final rule, which excludes only existing non-competes with senior executives) would diminish both costs and benefits, but would still result in substantial benefits on net.

a. Analysis of Lost Benefits and Costs if Senior Executives Are Excluded

Several costs and benefits may be affected if senior executives are excluded from coverage by the final rule. The Commission now discusses each of those costs and benefits relative to the final rule.

The Commission finds that some benefits related to labor market competition and workers' earnings would be lost if senior executives were entirely excluded from the final rule. This is especially true because those workers have high earnings, meaning that a given percentage increase in their earnings yields a greater overall effect compared with relatively lower earning individuals. However, those workers make up a small portion of the workforce—approximately 0.75% of the workforce, based on data from the American Community Survey.[1192] The overall change in the earnings benefit is therefore limited, but would exceed senior executives' share of the workforce. Support for this finding is discussed in Part IV.C. Garmaise (2011) finds that earnings of senior executives are negatively affected by non-competes. Countervailing evidence exists, but it is based on evaluation of the use of non-competes, which the Commission gives less weight.[1193] The Commission notes the definition of senior executive used in Garmaise (2011) does not map perfectly to the definition of senior executives in this final rule, though there is likely substantial overlap.

The Commission is unable to quantify the lost benefits related to innovation if senior executives were excluded from coverage under the final rule but finds their exclusion would diminish the innovation benefits of the final rule. Senior executives are involved in determination of the strategic path of the firm and its execution, which likely has a substantial effect on innovation. The Commission cannot quantify what percentage of the innovation effect is due to senior executives versus other workers, though it is likely shared by both groups.

The Commission finds that benefits related to consumer prices would fall significantly if senior executives were excluded from coverage. By increasing competition, increases in new firm formation and increased ability to hire talented workers may be key drivers of the effect of the final rule on consumer prices. As discussed in Part IV.C, senior executives have the knowledge and skills necessary to found new firms, or to be key members of other firms. Therefore, if senior executives are excluded from the final rule, some benefits associated with new firm foundation and innovation would be lost, though the exact proportion cannot be estimated. The Commission notes that benefits associated with lower prices through increased competition might also be lost but cannot be quantified.

Turning to costs, the Commission finds that costs associated with investment in human capital may fall if senior executives were excluded from the rule. The productivity of senior executives may benefit from investment in their human capital.[1194] The precise monetary contribution of investment in senior executives' human capital to the productivity of firms has not been estimated, nor has the empirical literature separately assessed the effect of non-competes on human capital investment for senior executives. If senior executives benefit from advanced, rather than core, training investment (as described in Part X.F.7.a), their exclusion will reduce costs. Because senior executives are a small part of the workforce and must be highly skilled, locking them up with non-competes could theoretically mean that firms would need to invest in relatively more core training for senior executives if they were excluded from the final rule.

The Commission finds that the direct costs of compliance with the final rule may be partially affected if senior executives were categorically excluded. The final rule allows employers to enforce existing non-competes for senior executives, so there are no notice and re-negotiation costs for senior executives. However, in this scenario, costs associated with ensuring incoming

[1192] In particular, 0.75% represents the percentage of employed individuals from 2017–21 ages 22–64, excluding residents of CA, ND, OK, and MN, and excluding workers reporting working for non-profits or the government, whose earnings are above the inflation-adjusted threshold and who are coded as having occupation ''Top Executive.'' The Commission notes that this estimate may not exactly match the definition in the final rule but the Commission believes that this provides a reasonable estimate.

[1193] *See* Part IV.A.2 (explaining the Commission's concerns with these types of studies).

[1194] Solomon Akrofi, *Evaluating the Effects of Executive Learning and Development on Organisational Performance: Implications for Developing Senior Manager and Executive Capabilities,* 20 Int'l. J. of Training and Dev. 177 (2016).

senior executives' contracts do not have non-competes would be substantially reduced. Because senior executives' contracts are generally more complex than other workers' contracts, this reduction may be relatively large, even though there are relatively few senior executives in the workforce (approximately 0.75%). With respect to the costs of updating contractual practices, commenters noted the costs of updating senior executives' contracts may be greater than for other workers because of the complexity of their contracts. Therefore, excluding senior executives categorically might reduce costs associated with updating contractual practices substantially. At the same time, senior executives' contracts may already be bespoke and individualized to such an extent that removing a non-compete would not considerably raise the costs associated with revising contractual practices. Moreover, these contracts may be even more likely than other workers to already include NDAs and other similar provisions.

Finally, the Commission finds exclusion of senior executives may reduce litigation costs from the final rule, though the overall effect is unclear. Senior executives are highly likely to have access to sensitive business information. To the extent costs associated with trade secret litigation or litigation over other restrictive covenants increase under the final rule, though no evidence supports this possibility, then exclusion of senior executives may substantially reduce these costs. Litigation related to whether a worker meets the definition of a senior executive may also increase if senior executives are categorically excluded.

Overall, excluding senior executives from the final rule would substantially reduce the benefits of the rule—especially those associated with new firm formation, innovation, and prices—but would also likely reduce costs, especially those associated with investment in human capital and updating contractual practices. The Commission finds that the benefits of a rule excluding senior executives would justify the costs of such a rule.

b. Analysis of Benefits and Costs to Workers Other Than Senior Executives

Now, the Commission turns to an analysis of the benefits and costs that remain if senior executives are excluded from the rule.

The Commission finds there would be substantial benefits to labor market competition and workers' earnings even if senior executives were categorically excluded. The evidence on earnings discussed in Part IV.B.3.a.ii does not exclude senior executives, but based on the percentage of the population that represents senior executives, the evidence largely pertains to workers other than senior executives. Therefore, while studies focused on senior executives (largely) do not apply, studies of the entire workforce mostly reflect the effects of non-competes on other workers. In addition to the broader evidence on earnings discussed in Part IV.B.3.a.ii, one study analyzes a population exclusively comprised of hourly workers, nearly all of whom are highly likely not to be senior executives, supporting the finding that even with senior executives excluded from a rule, there would be substantial benefits to labor market competition and workers' earnings.[1195]

The Commission is unable to quantify to what extent the estimated effects on innovation are driven by senior executives versus other workers, but still finds that a final rule excluding these senior executives would result in substantial benefits to innovation. First, there is evidence that productivity of inventors decreases when they take career detours because of non-competes.[1196] Second, insofar as effects on innovation are driven by increased idea recombination, having access to those ideas (which innovators actively engaged in R&D must) implies that moving to new firms would increase innovation. Empirical studies have not quantified the size of these effects relative to the overall effect of banning non-competes for workers including senior executives on innovation, however.

The Commission finds that a rule excluding senior executives would still yield substantial benefits with respect to consumer prices. Many entrepreneurs were not formerly senior executives, meaning that encouraging entrepreneurship among workers who are not senior executives by prohibiting non-competes will yield more business formation. That business formation increases competition, which may lead to lower prices. Additionally, firms will not be foreclosed access to talent (which is likely important across the spectrum of workers, though evidence only specifically exists for senior executives), which may also lead to lower prices. In the absence of empirical evidence demonstrating which workers' non-competes affect consumer prices, the Commission cannot estimate how much of the effect is due to coverage of which workers.

The Commission finds that a rule excluding senior executives would result in decreased levels of investment in workers' human capital. The empirical literature has not separately assessed the effect of non-competes on investment in human capital for senior executives versus other workers, though the study finding that training decreases with greater non-compete enforceability includes both workers who are and are not senior executives. The Commission therefore believes that some or much of any cost or benefit of the rule from changing investment in human capital would pertain to workers who are not senior executives. However, the Commission notes that, as discussed in Part X.F.7.a, if lost training under the rule is lost ''core'' (as opposed to ''advanced'') training, then the final rule will cause a cost *savings* for firms, which will have greater access to experienced workers and will therefore spend less on ''core'' training.

The Commission finds that the direct costs of compliance with the final rule may be partially diminished if senior executives were excluded. First, the Commission reiterates that notice is not required for senior executives under the final rule. Therefore, that component of the direct costs of compliance would not be affected. However, even with those senior executives excluded, costs associated with ensuring incoming workers' contracts do not have non-competes would still be present. Insofar as senior executives' contracts may be more complex than other workers' contracts, this cost may be substantially diminished, however. Similarly, with respect to the costs of updating contractual practices, as noted by commenters, these costs may be substantially greater for the contracts of senior executives due to the complexity of their contracts and the sensitivity of the information they possess. Therefore, while some costs associated with updating contractual practices would survive if senior executives were excluded, their exclusion may reduce costs associated with the rule disproportionately to their (relatively low) share of the workforce.

Finally, some litigation costs may still be present if senior executives are excluded. Litigation costs associated with non-competes would still likely fall for workers other than senior executives due to the bright-line coverage in the rule. Costs associated with litigation other than non-compete litigation may rise if firms turn to those methods, though no evidence suggests they will.

Overall, a rule that excludes senior executives will likely result in

[1195] Lipsitz & Starr, *supra* note 72.

[1196] Mueller, *supra* note 569.

substantial benefits, as well as some costs. While the Commission largely cannot quantify the extent to which benefits and costs would fall if senior executives were excluded from coverage under the rule, the Commission finds that the benefits quantified and monetized elsewhere in this impact analysis would likely be diminished relative to the final rule as adopted, especially those associated with innovation and prices, but costs would also be diminished, especially those associated with investment in human capital and updating contractual practices. The Commission finds that, even in the absence of a full monetization of all costs and benefits of the final rule, the final rule has substantial benefits that clearly justify the costs, which remains true even if senior executives were excluded from coverage.

XI. Regulatory Flexibility Act

The Regulatory Flexibility Act (''RFA''), as amended by the Small Business Regulatory Enforcement Fairness Act of 1996, requires an agency to provide an Initial Regulatory Flexibility Analysis (''IRFA'') and Final Regulatory Flexibility Analysis (''FRFA'') of any final rule subject to notice-and-comment requirements, unless the agency head certifies that the regulatory action will not have a significant economic impact on a substantial number of small entities.[1197] In the NPRM, the Commission provided an IRFA, stated its belief that the proposal will not have a significant economic impact on small entities, and solicited comments on the burden on any small entities that would be covered.[1198] In addition to publishing the NPRM in the **Federal Register**, the Commission announced the proposed rule through press and other releases,[1199] as well as through other outreach including hosting a public forum on the proposed rule [1200] and attending the U.S. Small Business Administration Office of Advocacy's (''SBA Advocacy'') roundtable on the proposed rule with small entities,[1201] in keeping with the Commission's history of small business guidance and outreach.[1202]

The Commission thereafter received over 26,000 public comments, many of which identified themselves as being from small businesses, industry associations that represent small businesses, and workers at small businesses.[1203] The Commission greatly appreciates and thoroughly considered the feedback it received from such stakeholders in developing the final rule. The Commission made changes from the proposed rule in response to such feedback and will continue to engage with small business stakeholders to facilitate implementation of the final rule. Further, the Commission is publishing compliance material to assist small entities in complying with the final rule.

Specifically, based on the Commission's expertise and after careful review and consideration of the entire rulemaking record—including empirical research on how non-competes affect competition and over 26,000 public comments—the Commission adopts this final rule, including with changes relative to the proposal to reduce compliance burdens on small business and other entities. For example, the Commission allows existing non-competes with senior executives to remain in force,[1204] amends the safe harbor notice requirement to ease compliance,[1205] removes the requirement to rescind existing non-competes, and removes the ownership threshold from the sale of business exception.[1206] In light of the comments, the Commission has carefully considered whether to certify that the final rule will not have a significant impact on a substantial number of small entities. The Commission continues to believe the final rule's impact will not be substantial in the case of most small entities, and in many cases the final rule will likely have a positive impact on small businesses. However, the Commission cannot fully quantify the impact the final rule will have on such entities. Therefore, in the interest of thoroughness and an abundance of caution, the Commission has prepared the following FRFA with this final rule.

Although small entities across all industrial classes—*i.e.,* all NAICS codes—would likely be affected, the estimated impact on each entity would be relatively small. The Small Business Administration (''SBA'') states that, as a rule of thumb, the impact of a rule could be significant if the cost of the rule (a) eliminates more than 10% of the businesses' profits; (b) exceeds 1% of the gross revenues of the entities in a particular sector; or (c) exceeds 5% of the labor costs of the entities in the sector.[1207] As calculated in Part XI.F, the Commission estimates that legal and administrative costs would result in costs on average of $712.45 to $1,250.93 for single-establishment firms with 10 workers.[1208] These costs would exceed the SBA's recommended thresholds for significant impact only if the average profit of regulated entities with 10 workers is $7,125 to $12,509, average revenue is $71,245 to $125,093, or average labor costs are $14,249 to $25,019, respectively. Furthermore, while there are additional nonmonetizable costs associated with the final rule, there are also nonmonetizable benefits which would at least partially offset those costs, as explained in Part X.F.6.

A. Reasons for the Rule

The Commission describes the reasons for the final rule in Parts IV.B and IV.C.

B. Statement of Objectives and Legal Basis

The Commission describes the objectives and legal basis for the final rule in Part IV.B and IV.C and the legal authority for the final rule in Part II.

[1207] SBA, *A Guide for Government Agencies: How to Comply With the Regulatory Flexibility Act,* at 19 (Aug. 2017) *https://advocacy.sba.gov/resources/the-regulatory-flexibility-act/a-guide-for-government-agencies-how-to-comply-with-the-regulatory-flexibility-act/* (hereinafter ''RFA Compliance Guide'').

[1208] Ten workers is chosen as an illustrative example. For this example, the Commission calculates the cost of notification based on 10 workers and applies legal costs consistent with the average per establishment cost calculated in X.F.7.

C. Issues Raised by Comments, the Commission's Assessment and Response, and Any Changes Made as a Result

1. Comments [1209] on Benefits to Small Businesses and the Commission's Findings [1210]

a. Comments

Numerous small businesses and small business owners generally supported the proposed rule and shared two primary reasons, among others, that the rule may uniquely benefit small business owners. First, because non-competes are expressly designed to prevent workers from starting new businesses within the industry and geographic market that worker is experienced in, commenters said non-competes prevent new business formation and threaten new small businesses. Thus, consistent with the empirical evidence,[1211] commenters said a ban on non-competes will drive small business creation as entrepreneurial employees will be free to compete against their former employers. Second, commenters said non-competes harm small businesses by preventing them from hiring experienced workers. The Commission considered all comments related to small businesses and addresses many of them in Parts IV.B and IV.C and throughout this document.

Many comments from small businesses align with the findings in Part IV.B.3.b.i, namely that non-competes inhibit new business formation. A vast majority of such new businesses will be small businesses. For example, Kang and Fleming find that when Florida made non-competes more enforceable, larger businesses entered the State and increased employment while small businesses entered less frequently, and employment for them did not change.[1212] An economist stated the NPRM's findings show that non-competes harm small business formation and that firms struggle to hire and grow in States that are more likely to enforce non-competes. Another commenter identified an additional study showing that Hawaii's ban on non-competes in the technology industry increased the number of technology startups.[1213]

Some commenters cited the Small Business Majority's polling data on non-competes. The survey finds that 67% of small businesses that currently use non-competes support the proposed ban [1214] and 46% of small business owners have been subject to a non-compete that prevented them from starting or expanding their own businesses.[1215] Additionally, 35% of small business respondents reported that they have been prevented from hiring an employee because of a non-compete.[1216] The survey also finds that of the 312 small businesses that responded, 59% expressed agreement that NDAs could likely protect confidential information or trade secrets as effectively as a non-compete.[1217] The online survey had a small sample size of 312 small business owners and decision-makers, and had a margin of error of +/−6%.[1218] An economist commented that these survey findings provide specific evidence underlying the mechanisms identified in the empirical studies finding that non-competes decrease new business formation and prevent new firms from hiring and growing. While the survey has too small of a sample size to be fully representative of small businesses, the survey illustrates that non-competes have prevented or delayed small businesses from starting or expanding.

Small businesses stated non-competes hindered their small business, including through costly lawsuits from former employers. Many commenters said non-competes were preventing them from starting a business.[1219] One technology startup organization cited the thousands of startups formed by alumni of five leading tech companies as well as key within-industry spinoffs in the aerospace industry and suggested the number of spinoffs could be greater with a nationwide ban on non-competes. The commenter stated that even delays in founding a startup slow innovation. The commenter looked at the employment history of these aerospace startup founders and stated that, while it could not determine whether they had non-competes, their work history suggested they were not constrained in the labor market.

Many small businesses commented that non-competes prevented them from hiring the right talent and harmed their businesses, often because small businesses could not afford a lawsuit or even the legal costs of determining whether a non-compete with a perspective employee was unenforceable.[1220] A technology startup organization stated that startups are much more likely to survive with experienced counselors and mentors.[1221] A policy organization stated that non-competes favor established and large companies, because they can use non-compete litigation strategically to chill movement of experienced executives to startups and smaller firms that lack the resources to contest the non-competes in court. The policy organization also stated workers with non-competes often go to an established competitor that has the resources to protect them in case of a suit rather than a small firm, meaning small firms are disadvantaged in hiring. Similarly, a law firm commenter stated that small firms are less able to compensate new hires who have forfeiture-for-competition clauses compared to larger firms.

Commenters made several other arguments in favor of the rule covering small businesses. Several commenters pointed out that small businesses have not struggled to thrive in States where non-competes have long been prohibited, including California, Oklahoma, and North Dakota. A startup organization agreed with data cited in the NPRM indicating non-competes disproportionately reduce entrepreneurship for women, and argued that disproportionate financial challenges for women mean women entrepreneurs have fewer resources to withstand other harms from non-competes, including lack of access to talent.[1222] A law firm stated that a small business exception to the rule would lead to an inefficient ''cliff'' effect, where small businesses who previously fell within the exception would need to

[1209] The U.S. SBA publishes a Table of Small Business Size Standards based on the North American Industry Classification System (NAICS), determining the maximum number of employees or annual receipts allowed for a concern and its affiliates to be considered small. 13 CFR 121.201; *see also* Small Bus. Admin., *Table of Size Standards, https://www.sba.gov/document/support-table-size-standards.* Because commenters did not provide their NAICS number or annual receipts, and many did not provide the number of workers, the Commission is unable to determine whether each individual commenter meets the SBA's definition of a small business. Instead, for purposes of considering comments from small businesses, the Commission relies on the commenter's self-description of being a small business or start-up.

[1210] This section captures comments related to the potential benefits of the final rule for small businesses. These comments do not directly address the IRFA. Comments on the IRFA are captured in Part XI.G. Many comments and issues concerning small businesses are also discussed in Part IV.B.3.b.i.

rescind their existing non-competes after surpassing a threshold. Finally, and importantly, numerous workers at small businesses reported substantial harms from non-competes consistent with the harms cited in Part IV.B.2 and IV.B.3.a, just as workers for large employers did.

b. Responses to Comments

As the Commission explained in Parts IV.B.3.b and IV.C.2.c, the weight of the empirical evidence supports the conclusion that non-competes inhibit new business formation and foreclose small and other businesses from accessing the talent they need to grow and succeed. Most new businesses are small, and non-competes are expressly designed to prevent workers from starting new businesses in the fields they know best. The Commission appreciates the small businesses and entrepreneurs who shared their experiences in the comments. These comments and the many comments discussed in Parts IV.B.2 and IV.B.3 from small businesses align with and bolster the empirical evidence. The comments illustrate the real-world impacts of non-competes on entrepreneurs and would-be entrepreneurs, both before and after formation of a business. Moreover, the labor market effects—including reducing labor mobility and artificially suppressing wages and job quality—are not different or mitigated when a worker works for a small business rather than a large one. Studies finding harm from non-competes examined both large and small businesses, and the Commission believes that small businesses' use of non-competes causes the same harms set forth in Parts IV.B and IV.C, including harm to other small businesses.

Based on these and other comments, the Commission believes that many small businesses are blocked from hiring workers that could help their business grow and have fewer resources than larger businesses to evaluate the risk of hiring a worker subject to a non-compete, to pay to ''release'' a worker they want to hire from a non-compete, such as a forfeiture-for-competition clause, and defend themselves from a non-compete suit.

In response to the comments on small business successes in States where non-competes are banned, the Commission notes that it recognizes that there are many successful small businesses in States that ban non-competes, but is not aware of any empirical evidence considering success rates of small businesses based on enforceability of non-competes.

In response to the comment discussing startups in the aerospace industry, the Commission notes that the conclusions of the commenter align with the empirical evidence that the most successful startups are within-industry spinoffs.[1223] However, the Commission notes that according to the data presented in the comment, some of the founders the comment described as being unrestrained in the labor market have significant gaps in their work history, though the Commission cannot determine the cause of any gaps.

As explained in Part IV.C, the Commission adopts a partial exception in § 910.2(a)(2) for senior executives under which their existing non-competes—non-competes entered into before the effective date—are not covered by the final rule. Employers cannot, however, enter into new non-competes with senior executives as of the effective date. The evidence and comments describing the importance of freeing senior executives from non-competes with respect to founding and supporting new and small businesses contributed to the Commission's decision to ban future non-competes for senior executives instead of excepting senior executives entirely from the final rule. The Commission is aware that existing non-competes with senior executives will reduce some of the benefits for new and small businesses as fewer senior executives will be free to join or found those businesses beginning on September 4, 2024. However, senior executives are a small, narrowly defined group, meaning there will still be numerous experienced workers freed from non-competes that can found or support small businesses, and senior executive non-competes will eventually become phased out. In addition, the Commission expects small businesses to receive the other anticipated benefits of the final rule.

2. Comments Arguing the Rule Will Harm Small Businesses and the Commission's Findings [1224]

a. Comments

Some small businesses and industry groups stated they believe a ban on non-competes would harm small businesses. Several commenters requested an exception for small businesses or certain types of small businesses, such as independent medical practices. The Commission addresses these comments in this Part XI.C.2 and addresses direct potential costs in Part XI.E. The Commission appreciates the small businesses and entrepreneurs who shared their experiences in the comments.

Commenters raised concerns that eliminating non-competes for all businesses would allow larger businesses and incumbents to easily hire away talent from smaller competitors and startups. Other small businesses said they had been harmed in the past by former workers competing against them, including by recruiting clients and other workers, or by large competitors hiring their workers. Similarly, some industry associations and small businesses said non-competes protect independent businesses, including medical practices, from dominant consolidators, as high recruitment, retention, and other costs may induce small businesses to sell their business to consolidators. Relatedly, some healthcare organizations argued a ban that does not cover nonprofit hospitals and health systems would provide those large nonprofits with an unfair advantage over independent medical practices.

Some small businesses offered the same justifications as other businesses for using non-competes but emphasized the heightened potential damage to smaller businesses less able to bear costs, including being forced to close or sell.[1225] Many of these comments asserted that small businesses relying on legitimate trade secrets would be especially harmed if a worker took that information to a competitor or new business, particularly because they would be least equipped to detect theft or retain sophisticated legal counsel to litigate potential trade secrets or NDA claims, thus reducing investment and innovation.[1226] A law firm argued that trade secrets litigation often costs millions, and few attorneys are willing to work on contingency, so startups would struggle to litigate against larger well-financed firms, especially as large firms can drive costs up to force the startup out of the litigation. SBA Advocacy asserted that if competitive information is not protected, some small businesses could face a serious risk of loss or potential closure and could not afford alternative means of protection.

One industry organization stated more generally that protecting information is a high priority for emerging growth companies. Some small businesses

[1223] *See* Part IV.B.3.b.i.

[1224] This section captures comments that do not directly address the IRFA but that are related to the potential costs of the final rule for small businesses. Comments directly addressing the IRFA are captured in Part XI.G. Many comments concerning small businesses are also discussed in Part IV.B.3.b.i.

[1225] *See, e.g.,* SBA Off. of Advocacy, FTC–2023–0007–21110 at 3.

[1226] *Id.*

stated if non-competes are banned, they might silo workers and information to limit the potential harm from a worker leaving for a larger competitor and would harm the business. One business stated that while banning non-competes might allow more market entrants, those new entrants will be more likely to fail without the protection of non-competes for worker retention and confidential information. Some business associations stated small business owners often rely on independent contractors and sole proprietors such as marketers to build their businesses and share proprietary information with them (meaning contractors may have access to information from multiple competitors) and covering such groups under the rule would harm their growth.

Small businesses also stated they use non-competes to protect investments, including in training, to prevent workers from taking clients or customers, and to increase retention and stability. For example, some small businesses shared that they started using non-competes after workers they had trained extensively went to a larger competitor or started their own business. One small business organization stated the proposed requirement to relate ''costs incurred'' to TRAPs would be harder for small businesses who are more likely to train on the job. A physician practice stated a partner leaving for a hospital would destabilize and increase costs for the practice, but a non-compete that is bought out helps practices afford those extra costs or otherwise prevents destabilization.

Commenters provided additional reasons small businesses use non-competes. A business stated that they could not afford to pay workers as much as larger businesses, so will be unable to find workers. A small business association stated that banning non-competes would exacerbate the labor shortage for small businesses by decreasing investment in training, when there are already insufficient qualified applicants. A commenter stated that the NPRM did not provide any examples of small businesses using non-competes in an unfair way. SBA Advocacy also stated that some small business employment contracts compensate workers for non-competes. One business stated small businesses may not be able to afford to fight larger businesses using borderline *de facto* non-competes.

A banking association stated new businesses that cannot protect their business would be less able to attract capital than more established businesses, while a community bank similarly said it may be unable to lend to small businesses that cannot protect their workers, customers, and proprietary information with non-competes. A small business stated that NDAs and non-solicitation clauses were too difficult to enforce, as it was told by judges that in order to win a non-solicitation suit against a former worker who purportedly took clients, the business would need to subpoena its own former clients to testify, which would damage the business's reputation.

A physician said they were able to start an independent practice while complying with a non-compete and hire others in compliance with their non-competes. One small business said they were able to work out solutions when hiring a worker subject to a non-compete to avoid violating it.

SBA Advocacy relayed the concern of one 8(a) [1227] small business that feared if entities in the 8(a) business development program cannot control their talent, the money the Federal government has spent helping these companies would be wasted. Accordingly, SBA Advocacy asserted that the proposed rule conflicted with the Congressional law creating the 8(a) program.[1228]

A small Federal contractor stated that larger companies could poach workers who are skilled and/or who are already cleared by the government to work on projects from small businesses, potentially putting them out of business, and would damage contractors' ability to provide stability to the agencies.

Some commenters expressed concern that the proposed 25% threshold [1229] for the sale of business exception would cause small businesses to lose value when acquired because owners and key workers are critical contributors to the business and non-competes are intangible assets, making buyers less likely to buy. Some commenters requesting a small business exception suggested various definitions of ''small business,'' including based on the number of employees.

Finally, SBA Advocacy encouraged the Commission to adopt an approach addressing the different concerns of small entities and consider, analyze, and tailor alternatives to the size and type of entity to minimize adverse impacts to small entities.[1230] It stated that a categorical ban was inappropriate given the range of industries and nature of economic impacts.[1231] One business requested an exception for highly paid workers at small businesses, to create a predictable bright-line rule while leveling the playing field for small businesses. An industry association asked for an exception for newly formed businesses to encourage capital formation among start-up entities.

b. Responses to Comments

First and foremost, the Commission finds, based on its expertise, the empirical evidence, and the record before it, that non-competes tend to negatively affect competitive conditions in both labor and product and service markets, including by inhibiting new business formation.[1232] The Commission is not aware of any empirical research on existing firm closures—including small business closures—being correlated with decreased non-compete enforceability. The Commission is also not aware of empirical research on specific business closure patterns. Rather, the empirical evidence shows that non-competes overall increase new business formation and decrease concentration, indicating that the final rule will likely increase the overall number of small businesses. The Commission is focused on the aggregate effects of non-competes on competitive conditions and here considers the overall effect on small businesses. While an individual small business may benefit from prohibiting one of its workers from joining a competitor or from keeping a competitor from entering the market, non-competes have a substantial net negative aggregate impact on competitive conditions in both labor markets and product and services markets, including negative spillover effects on other small businesses that do not use non-competes.[1233]

The Commission has assessed the evidence on protection of trade secrets and proprietary information in Part IV.D and finds that businesses have sufficient, less restrictive alternatives to protect such information. These options, such as NDAs, protection under trade secrets law, and importantly, competing

[1227] Sections 7(j)(10) and 8(a) of the Small Business Act (15 U.S.C. 636(j)(10) and 637(a)) authorize the SBA to establish a business development program, which is known as the 8(a) Business Development program. The 8(a) program is a robust nine-year program created to help firms owned and controlled by socially and economically disadvantaged individuals. [1233] *See id.*

on the merits to retain workers, are also accessible to small businesses. On the latter, small businesses have potentially distinct options from larger firms because of their greater ability to be flexible and responsive to their workers' preferences. Moreover, the Commission notes that no evidence exists to support the hypothesis that trade secret litigation will increase after the final rule takes effect. Recent evidence suggests trade secret litigation does not increase following bans on non-competes.[1234] With a bright-line rule banning non-competes, small businesses, like other business, will not face or have to undertake litigation related to non-competes, which may partially offset other litigation costs if firms do substitute other litigation. In fact, the purported dynamic where small firms are outspent and outmatched by large firms that drive up the cost of trade secrets litigation, is the exact dynamic many small businesses face when sued over a non-compete, which can also force small businesses to close.[1235] While the Commission does not have data on the frequency of each type of litigation or how often it forces small businesses to close, these comments indicate that this alleged legal threat is already present in a different form. Moreover, the overbreadth of non-competes that employers cite as the source of their benefits for reducing litigation costs is also the source of the negative effects of non-competes on competitive conditions, and pecuniary benefits to a firm engaged in an anticompetitive practice are not a cognizable justification for an anticompetitive practice.[1236]

Additionally, the Commission is unaware of any evidence that small businesses in States where non-competes are less enforceable are more likely to experience trade secret misappropriation, or evidence that small businesses are at a distinct disadvantage in these States. Finally, the Commission notes that despite claims that using non-competes to protect trade secrets supports innovation, the empirical evidence shows increased enforceability of non-competes on net in the aggregate harms innovation. Again, the Commission considers the overall effect on all business, including small businesses, and finds that the final rule will not reduce innovation by small business.

In response to the comments that businesses would limit sharing confidential information with their workers or that a small business's inability to protect confidential information would cause new businesses to fail, the Commission notes that use of less restrictive alternatives, including, for example, NDAs, fixed term contracts, and worker retention policies, would allow small businesses to maintain the same or near same level of protection for the confidential information they might share and want to protect. Accordingly, to the extent it is productive for a small business to protect such information or share it with a worker, the firm would adopt these alternatives and be able to continue to operate with the same or similar use of confidential information. Moreover, the Commission is not aware of any empirical evidence supporting the conclusion that firms would share less confidential information or be less able to protect it. In fact, the evidence shows that both within-industry and non-within industry spinouts are better quality, on average, when non-competes are less enforceable, which reinforces the conclusion that small businesses do not rely on non-competes to thrive.[1237] Indeed, no empirical evidence shows new businesses fail at a higher rate when (or because) non-competes are less enforceable. To the extent some businesses may choose to limit information sharing (as some individual comments suggest), the Commission concludes that the benefits of the final rule with respect to earnings, new business formation, and innovation justify any limited resulting negative effect.

In Parts IV.D.1 and X.F.7.a, the Commission examines the evidence on human capital investment and other investment and finds uncertainty regarding whether the effects on training and other investment will be benefits or costs under the final rule. The Commission distinguishes between core training and advanced training, finding that businesses may be able to spend less on core training under the final rule to the extent businesses are able to better match workers with their needs. The Commission similarly finds that new business formation under the final rule could result in an increase in overall capital investment or serve to offset any decreased capital investment in incumbent firms. As noted in comments from small businesses, non-competes limit their ability to hire experienced, productive workers. While it may be true in some cases that large businesses will be able to ''poach'' workers from smaller business, smaller businesses would also be better able to hire talent from large (or other) businesses under the final rule. In fact, theoretically, the final rule would be more beneficial to smaller businesses because they would no longer be hamstrung by the threat of non-compete litigation by large firms when hiring experienced workers from those firms. To the extent large firms can afford to pay out a worker non-compete or to litigate or threaten litigation to secure talent they want from a small firm, a ban on non-competes will better level the playing field between small and large firms competing for talent. While as stated by one commenter, some small businesses may be successful if they are able to use non-competes, the empirical evidence supports the conclusion that new business formation will increase overall under the final rule, and the Commission is not aware of any evidence of small business closure patterns. Businesses also have other alternatives to retain workers.[1238] Finally, the empirical evidence demonstrates ways in which non-competes advantage large businesses against smaller ones.[1239]

In response to comments that argued non-competes were needed to promote stability and worker retention, the Commission notes there is no evidence that stability and worker retention are economically productive in and of themselves. The overall evidence on the harms from non-competes demonstrates that retention of workers through non-competes has considerable costs to both labor markets and product and service markets. Importantly, businesses also have other, less restrictive alternatives—that do not tend to negatively affect competitive conditions—to retain workers as discussed in this Part and in Part IV.D.2. In response to the comment that small businesses will be less likely to afford retaining workers than large businesses that can pay more, the Commission notes that increases in innovation are likely to make small businesses more productive and successful, allowing them to better compete with their larger competitors. Moreover, the Commission notes that, in addition to those retention alternatives, many workers commented that their non-competes prevented them from seeking jobs with better working

[1234] Greenwood, Kobayashi, & Starr, *supra* note 757. The Commission notes that this study supplements—but is not necessary to support—its finding that no evidence supports the conclusion that litigation costs will increase under the final rule. That finding is based on the Commission's expertise and the rulemaking record, including relevant comments. This study was published after the close of the comment period.

[1235] *See* Parts IV.D and X.F.7.c.

[1236] *See* Part II.F.

[1238] *See* Part IV.D.2.

[1239] *See* Part IV.B.3.b.

conditions, shorter commutes, more flexible hours, or more career advancement opportunities, among others.[1240] Small businesses have ways to compete for workers beyond wages alone.

Many of the comments from small businesses, as well as from other commenters, appear to confuse non-competes with other types of agreements, such as non-solicitation agreements or NDAs, and argue that non-competes are needed to prevent former workers from taking the employer's customers or clients or disclosing confidential information. The final rule does not ban non-solicitation clauses unless they meet the definition of non-compete clause.[1241] While one commenter argued that non-solicitation clauses may be more difficult to enforce than non-competes, the Commission weighs the cost of this potential increased difficulty against the harms from non-competes and finds that any marginal benefit compared to a non-solicitation clause does not justify the costs of non-competes. And as explained previously, pecuniary benefits to a firm from an anticompetitive practice are not a cognizable defense.[1242]

In response to comments that small businesses are more reliant on independent contractors and without non-competes independent contractors might have access to confidential information for multiple competitors, the Commission first notes that the final rule does not prohibit agreements preventing a worker from working for two firms simultaneously.[1243] Many alternatives to non-competes allow businesses working with independent contracts to protect their confidential information, including maintaining security of confidential information as well as NDAs and other such agreements, as described in Part IV.D. There is no evidence that independent contractors are more likely to use or share confidential business information and, in fact, they are likely to be working under an agreement detailing their responsibilities and to be more familiar with ways to assure clients that any confidential business information shared with them will remain confidential.

In response to comments that banks might decrease lending without non-competes, the Commission notes that there is no indication that small businesses in States that have banned or limited non-competes have been unable to obtain financing and commenters provide no related evidence. Again, small businesses will have less restrictive alternatives as a means of protecting confidential information. Moreover, with respect to new business formation, workers seeking to start their own businesses will be able to reassure banks that their business will not face the threat of litigation or a court enjoining them from continuing with their business because of a non-compete.

In response to SBA Advocacy's comment on compensation for non-competes, the Commission considered this issue in Part IV.C. and decided to allow existing non-competes with senior executives, which the Commission finds are most likely to have involved consideration, to remain in force.

In response to the comment on the 8(a) business development program, the Commission notes that there are likely program participants in States where non-competes are banned or partially banned and, thus, are not able to use non-competes. Moreover, the program aims to help firms owned and controlled by socially and economically disadvantaged individuals with various supports and assistance to improve their success in securing government contracts. There is no basis to believe such assistance hinges on these small businesses being able to use non-competes with their workers. Like other firms, program participants have viable, less restrictive alternatives that do not tend to negatively affect competitive conditions. The evidence presented in this Part shows that on the whole, small businesses—including 8(a) participants—are expected to benefit from the ban on non-competes by, for example, having a larger pool of talent from which to hire workers.

In response to the comment that large businesses may use borderline *de facto* non-competes, the Commission notes that it provides greater clarity on the definition of non-compete clause in Part III.D, which the Commission believes will reduce both confusion and evasion. To the extent the commenter is raising the possibility that such other restrictive employment terms may tend to negatively affect competitive conditions, the Commission notes that section 5 and the other antitrust laws apply to those terms and govern whether such terms might be unlawful.

In response to comments on the proposed sale of business threshold, as explained in Part V.A, the Commission is eliminating the 25% threshold, meaning more small businesses will be able to utilize non-competes for more owners when they are selling their business. While individual businesses might see decreased value in a sale from being unable to use non-competes for workers, any decrease is justified by the net aggregate benefits of freeing labor markets and product and service markets from non-competes. Again, pecuniary benefits to a firm engaged in an anticompetitive practice is not a cognizable defense.[1244]

In response to the proposed definitions of ''small business,'' first, as explained in Part X.H, the Commission declines to create an exception for small businesses. Second, the SBA already defines ''small business'' based on size standards set forth in 13 CFR 121.201, and agencies are prohibited from deviating from this definition without following the procedures set out in 13 CFR 121.903.[1245]

In response to the comments arguing that the Commission's jurisdiction does not extend to tax-exempt nonprofit hospitals and healthcare organizations and that the final rule would, thus, give large nonprofits an unfair advantage over small practices, the Commission addresses this question in Parts II.E.2 and V.D.4. In response to the comment on difficulties in using TRAPs under the proposed rule, the Commission notes the final rule does not ban TRAPs, but covers terms and conditions of employment that meet the definition of non-compete clause as delineated in § 910.1 and described in Part III.D.

The commenter asserting that the final rule would exacerbate a labor shortage for small businesses did not provide evidence to support this claim. The Commission, however, finds that a ban on non-competes will increase labor mobility and enable skilled workers who are currently trapped by non-competes to work for others in the industry.

Finally, the Commission notes that numerous workers at small businesses have shared how non-competes have harmed them.

The Commission has carefully considered all of SBA Advocacy's and other stakeholders' comments, including those requesting a small business exception. The Commission has made the following changes, which the Commission believes will benefit small entities: adding an exception for existing senior executive non-competes; amending the notice requirement to ease compliance; and eliminating the sale of

[1245] RFA Compliance Guide, *supra* note 1207 at 14. One business suggested that the SBA definition is prone to confusion and litigation but did not provide any additional information to explain why or how.

business ownership threshold. The Commission believes that the final rule will benefit small businesses overall. The Commission notes that no State has exempted small businesses from any State statutes regulating non-competes.[1246] There is no empirical evidence that a small business exception is necessary or appropriate. Further, the evidence indicating that a ban on non-competes will benefit the economy accounts for non-competes used by both large and small businesses. In sum, the evidence indicates the final rule will, in the aggregate, benefit both small businesses and workers who work for small businesses—not to mention the consumers who in turn benefit. More small businesses are expected to enter the market, and the final rule will remove barriers to their growth.

D. Comments by the Chief Counsel for Advocacy of the SBA, the Commission's Assessment and Response, and Any Changes Made as a Result

The Commission received and carefully reviewed the comment from the SBA.[1247] The issues raised by the SBA and the Commission's responses are included in Parts XI.C and XI.F.

E. Description and Estimated Number of Small Entities to Which the Rule Will Apply

The final rule will impact all small businesses, across all industry classes, that use non-competes. It may also impact some small businesses that do not use non-competes but are impacted by other businesses' use of non-competes. The Commission does not expect that there are classes of businesses which will face disproportionate impacts from the final rule.

For the vast majority of industries, there is no nationwide granular data regarding the percentage of firms that use non-competes, which would facilitate calculating the number of small entities in a given industry using non-competes. Because of this data limitation and given the relatively stable percentage of firms using non-competes across the size distribution,[1248] the Commission estimates the total number of small firms across all industries in the U.S. economy. The Commission then calculates the number of firms estimated to use non-competes by applying an estimate of the percentage of firms using non-competes to that total. Using the size standards set by the SBA,[1249] the Commission calculates that there are 5.25 million small firms and 5.48 million small establishments in the U.S.[1250] Assuming that 49.4% of firms or establishments use non-competes,[1251] an estimated 2.59 million small firms, comprising 2.71 million small establishments, would be affected by the final rule. These calculations—the counts of businesses and the percentage of businesses that use non-competes—are based on small businesses with employees, since sole proprietorships are unlikely to use non-competes. Since the estimate cannot account for differential use of non-competes across industries, these firms span all industries and various sizes below the standards set in the SBA's size standards.

The Commission sought comments on all aspects of the IRFA, including the description and estimated number of small entities to which the rule would apply. A business association claimed the IRFA estimated the number of small businesses solely based on one incomplete study, the Colvin and Shierholz study, which it argued counted only firms with no union members who said all employees signed non-competes, risking significantly undercounting the number of impacted businesses. This comment misreads the study. The cited statement explained that when tabulating the share of businesses where all employees sign non-competes, the study counted only firms with no union members as it did not have information on whether union members signed non-competes.[1252] That does not mean that only firms with no union members where all employees signed non-competes were included in the study. In fact, the study divided its results between the share of workplaces where all employees and only some employees were subject to non-competes.[1253] The comment cites to only one component of the study results. Moreover, the study states that anecdotal evidence indicates it is rare for unions to agree to non-competes,[1254] and comments the Commission received align with that anecdotal evidence.

F. Projected Reporting, Recordkeeping, and Other Compliance Requirements

To comply with the final rule, small entities must do three things. First, to comply with §§ 910.2(a)(1)(i) and 910.2(a)(2)(i), which state it is an unfair method of competition to enter into a non-compete with a worker, small entities can no longer enter into new non-competes with incoming workers, including senior executives. This may include revising human resources materials and manuals and template or form contracts to ensure they are not misused on a forward-going basis, and making strategic decisions regarding workers' employment terms. Second, to comply with § 910.2(a)(1)(ii) and (iii), small entities cannot enforce (or make misrepresentations about) existing non-competes for workers other than senior executives after the effective date. That is, businesses must refrain from suing or threatening to sue workers other than senior executives regarding a non-compete after the effective date; but formal contract rescission is not required. Third, businesses must provide notice to workers other than senior executives that the worker's non-compete will not be enforced against the worker. The Commission provides a safe harbor notice that must be provided only to workers with known contact information. These foregoing steps entail some potential legal and administrative costs.

As calculated in Parts X.D.1.a and X.D.2.a, the Commission estimates the legal and administrative costs would

[1246] *See generally* Beck Reed Riden Chart, *supra* note 1052. In 2023, Maryland increased its non-compete compensation threshold to $19.88 per hour and set a slightly lower threshold for small employers at $19.20 per hour. Md. Lab. & Empl. Code sec. 3–716.

[1247] SBA Off. of Advocacy, FTC–2023–0007–21110.

[1248] *See* Colvin & Shierholz, *supra* note 65 at 5. The Commission emphasizes that, since smaller firms generally use non-competes at a lower rate, based on the numbers reported in Table 1, the estimate of the number of affected small entities is likely larger than is true in practice.

[1249] *See* Small Bus. Admin., *Table of Size Standards, https://www.sba.gov/document/support-table-size-standards.*

[1250] The Commission uses the latest data available from the Census Bureau's Statistics of U.S. Businesses database, available based on firm revenue and firm size. Census Bureau, *Statistics of U.S. Businesses (SUSB)* (last revised Nov. 17, 2023), *https://www.census.gov/programs-surveys/susb.html.* Values are deflated to current dollars using *https://www.bls.gov/data/inflation_calculator.htm.* As used in this analysis, per the Census Bureau, ''a firm is a business organization consisting of one or more domestic establishments in the same geographic area and industry that were specified under common ownership or control.'' On the other hand, ''an establishment is a single physical location at which business is conducted or services or industrial operations are performed.'' *See* Census Bureau, *Glossary, https://www.census.gov/programs-surveys/susb/about/glossary.html.* The number of small firms calculated here has decreased compared to the IRFA based on the updated Census Bureau data and SBA size standards.

[1251] *See* Colvin & Shierholz, *supra* note 65. The Commission notes that the estimated percentage of firms which use non-competes is based on a survey of businesses with employees. In addition, the Small Business Majority's recent survey of small businesses finds that 48% of respondents use non-competes. Sm. Bus. Majority Opinion Poll, supra note 1214. The Commission does not find that this survey has a sufficiently representative sample size to be considered definitive but notes that it aligns with the Colvin & Shierholz estimate.

[1252] *See* Colvin & Shierholz, *supra* note 65.

[1253] *See generally id.*

[1254] *Id.*

total $538.48 to $1,076.96 for each small firm, plus an additional $155.85 for each establishment owned by that firm, plus an additional $1.81 per worker. A single-establishment firm with 10 workers, for example, would bear estimated costs of $712.45 to $1,250.93.[1255] Only a small portion of the average cost estimated for each small firm—$155.85 per establishment, plus $1.81 per worker—is required under the rule. The remainder of the estimated cost is attributable to legal costs which firms may (but are not required to) undertake to revise their contractual practices. The FRFA assumes that the value of human resource professionals' times and legal professionals' time is equal to twice their average wages, which results in updated estimates.[1256] In an abundance of caution, the Commission has erred on the side of overestimating costs.

As described in greater detail in Part X.F.7.a, the Commission also finds that firm investment in human capital may increase or decrease under the final rule, depending on the type of training affected. Given the evidence available, the Commission is unable to fully monetize the estimates of firm investment in human capital. It concludes, however, that even in the absence of a full monetization of all costs and benefits of the final rule, the final rule has substantial benefits that clearly justify the costs.

1. Legal Costs

To ensure that incoming workers' contracts do not include non-competes and that they fully comply with the final rule, firms may employ in-house counsel, outside counsel, or human resource specialists (depending on the complexity of the relevant non-compete). For many firms, this process would likely be straightforward (*i.e.,* simply not using non-competes or removing one section from a boilerplate contract). Other firms may have more complex agreements or choose to use more time. The Commission assumes that, on average, ensuring that contracts for incoming workers do not have non-competes would take the equivalent of one hour of a lawyer's time (valued at $134.62),[1257] resulting in a total cost of $134.62*2.71 million = $364.8 million. There may be substantial heterogeneity in the costs for individual firms; however, the Commission believes this number is conservative. For firms whose costs of removing non-competes for incoming workers is greater, the work of ensuring that contracts comply with the law would overlap substantially with the costs of updating contractual practices, described in Part X.F.7.b.

For each establishment of each firm, estimated direct compliance costs total $21.23 + $134.62 = $155.85, plus $1.81 per worker with a non-compete.

Some business commenters have indicated that they may add or expand the scope of NDAs or other contractual provisions. This legal work is not mandated or required by the rule; it would be undertaken only by the subset of firms and workers for whom firms conclude that such alternatives would be desirable. Additionally, such adjustments are likely unnecessary for senior executives whose non-competes continue to be enforceable under the final rule. Therefore, this component additionally involves identifying senior executives whose existing non-competes are unaffected. For any such legal work, firms may use in-house counsel or outside counsel. To do so, firms may use in-house counsel or outside counsel to revise current contracts or enter into new, different contracts with workers.

The Commission is not aware of empirical evidence on how much it costs firms to revise their contractual practices when they can no longer use non-competes, and commenters did not provide evidence on costs. However, there is evidence indicating that firms that use non-competes are already using other types of restrictive employment provisions. Balasubramanian et al. find that 95.6% of workers with non-competes are also subject to an NDA, 97.5% of workers with non-competes are also subject to a non-solicitation agreement, NDA, or a non-recruitment agreement, and that 74.7% of workers with non-competes are also subject to all three other types of provisions.[1258] Firms that are already using multiple restrictive covenants may not need to expand the scope of existing restrictive employment provisions or enter into new ones.

Among the approximately one half of firms that use non-competes,[1259] the Commission assumes that the average firm employs the equivalent of four to eight hours of a lawyer's time to revise its contractual practices.[1260] The Commission emphasizes that this is an average to underline the fact that there would likely be large differences in the extent to which firms update their contractual practices. Many firms, including those that use non-competes only with workers who do not have access to sensitive information, or those that are already using other types of restrictive employment provisions to protect sensitive information, may opt to make no changes. Other firms may employ several hours or multiple days of lawyers' time to arrive at a new contract.[1261] The estimated range of four to eight hours represents an average taken across these different possibilities. For example, if two-thirds of firms that currently use non-competes opt to make no changes to their contractual practices (for example, because their workers are among the 97.5% of workers that already have other post-employment restrictions, or because they will rely on trade secret law in the future, or because they are using non-competes with workers who do not have access to sensitive information), and one-third of such firms spend (on average) the equivalent of 1.5 to 3 working days of an attorney's time, this would result in the estimate of 4–8 hours on average.

The Commission further emphasizes this estimate is an average across all employers that would be covered by the final rule. There is likely substantial heterogeneity in the amount of time firms would use to revise contractual practices; very large firms that use non-competes extensively would likely incur greater costs.

Under the assumption that the average firm that uses a non-compete employs the equivalent of four to eight hours of a lawyer's time, this analysis calculates the total expenditure on updating contractual practices to range from $134.62*4*2.59 million = $1.4 billion to $134.62*8*2.59 million = $2.8 billion. Note that this assumes decisions regarding protection of sensitive information and contract updating are

[1255] "Ten workers" is chosen as an illustrative example.

[1256] See Part X.F.7.b for a detailed description of the calculation and assumptions. The Commission notes that a typographical error in the IRFA resulted in the Commission reporting preliminary figures that were substantially larger than the comparable calculations in the preliminary section 22 analysis, which accounts for some of the differential between the preliminarily reported figures in the IRFA and the final estimates here.

[1257] BLS, *Occupational Outlook Handbook, Lawyers* (last modified Sept. 6, 2023), *https://www.bls.gov/ooh/legal/lawyers.htm* (updated for inflation to 2023 dollars and based on updated BLS data). Assumed lost productivity is twice the median wage.

[1258] Balasubramanian, Starr, & Yamaguchi, *supra* note 74. The value 97.5% is calculated as (1–0.6%/24.2%), where 0.6% represents the proportion of workers with only a non-compete, and no other post-employment restriction, and 24.2% represents the proportion of workers with a non-compete, regardless of what other post-employment restrictions they have.

[1259] Colvin & Shierholz, *supra* note 65 at 1.

[1260] Part X.F.7.b.i.

[1261] These estimates are derived from outreach to employment attorneys active in assisting firms in writing their non-competes. Commenters did not provide additional information or data that could be used to update these estimates.

made at the firm, rather than establishment, level, since sensitive information is likely shared across business establishments of a firm.

For each affected small business, the estimated cost of updating contractual practices is $134.62*4 = $538.48 to $134.62*8 = $1,076.96.

2. Administrative Costs for Notification Requirements

To reduce compliance costs and increase compliance certainty, § 910.2(b)(5) provides that an employer complies with the notice requirement in § 910.2(b)(1) where it provides notice to a worker pursuant to § 910.2(b)(4). Furthermore, § 910.2(b)(4) includes model language that constitutes notice to the worker that the worker's non-compete is no longer in effect. The Commission estimates that composing and sending this message in a digital format to all of a firm's workers and applicable former workers for whom digital contact information is available would take 20 minutes of a human resources specialist's time.[1262] According to BLS, the median wage for a human resources specialist was $31.85 per hour in 2023.[1263] The cost of compliance for currently employed workers with digital contact information available is therefore ($31.85*2)/3 = $21.23 per establishment. As estimated in Part XI.E, there are 2.59 million small firms, comprising 2.71 million small establishments, in the U.S. that use non-competes.[1264] Conservatively assuming that each establishment must engage in its own communication (*i.e.,* that a firm's headquarters does not have the ability to send a company-wide email, for example), this means that the total direct compliance cost for workers who are already employed and for whom digital contact information is available is $21.23*2.71 million = $57.5 million.

Each small firm must additionally mail notice to workers with non-competes for whom a physical address is available, but digital contact information is not. The cost per notice is estimated as 5 cents for one printed page plus mailing cost of 70 cents plus one minute of an HR professional's time, at $63.70 per hour, for a total of $1.81 per notice. Given an estimated count of affected workers with non-competes at small businesses of 584,843,[1265] the overall cost of mailed notice provision is therefore estimated to be $1.1 million.

G. Comments and Responses to Comments on the IRFA

The IRFA explained the Commission's preliminary assessment of the direct compliance costs for employers, both for rescinding non-competes for workers who are already employed as well as the costs of an attorney to ensure contracts for incoming workers do not have non-competes.[1266] The IRFA also explained the Commission's assessment of the costs of updating contractual practices, if the employer seeks to do so, by expanding the scope of other contractual provisions to protect trade secrets and other valuable investments.[1267] The Commission sought comment on all aspects of the IRFA.[1268]

In support of the proposed rule, one employment law firm said there are no significant recurring compliance costs to the final rule that would create an undue burden for small employers compared to larger employers. The Commission agrees. The final rule is designed to require only a one-time action and no recurring compliance requirements in order to minimize compliance costs for employers. A technology startup organization said the rule would save small businesses significant legal costs from the complex legal analysis currently necessary when trying to hire a worker subject to a non-compete, particularly when trying to assess the patchwork of State laws, ''reasonableness'' tests, and choice-of-law issues, which startups have few resources to pay.

Some commenters raised concerns about the preliminary assessment of direct compliance costs, primarily concerning unsubstantiated costs of consulting with counsel. Some commenters said small businesses would need to consult with outside counsel to ensure they properly comply with the final rule, though they did not explain why. Another business association said most small businesses do not have the organizational development required to issue the notice and would need to hire outside counsel. A group of industry associations said the estimated costs of $317.68 to $563.84 were not realistic and did not reflect the cost of discussions with outside counsel on its existing agreements and contracts and its contract negotiation practices, but the comment did not provide information to support a different estimate. Some commenters argued that small businesses lacking internal counsel or employment lawyers on retainer would face substantial unplanned expenses when seeking outside counsel on whether other restrictive covenants violated the proposed *de facto* non-compete provision. These commenters did not provide cost estimates.

First, in response to the proposed rule's Preliminary Regulatory Impact Analysis, commenters discussed that the estimated compliance costs and costs of contractual updating may underestimate true costs for the broader business community and provided alternative estimates of the time employers might spend complying with the rule and updating contractual practices, as well as the charged rates of outside counsel. These comments are addressed in the sensitivity analyses presented in Part X.F.7. The Commission has also updated the estimated legal costs in this Part. Commenters also argued that small businesses would face greater costs associated with the use of outside counsel but did not quantify those costs for small businesses. Again, the Commission provides a sensitivity analysis reflecting the cost of experienced outside counsel for all firms in Part X.F.7.b.i. Moreover, as the Commission notes, the estimate reflects significant heterogeneity, so that it is likely that some firms will simply be able to remove the paper or electronic copy of the non-compete from their website or workplace manual—requiring no attorney time—while others, like the commenter, may spend more time consulting with counsel.

Second, in response to these and other comments and as explained in Part III.D, the definition of non-compete clause has been revised to reduce confusion and give employers and workers a clearer understanding of what is prohibited, which will in turn reduce compliance costs. Third, the FRFA includes updated compliance costs to reflect any remaining need to assess contracts under § 910.2(a). Fourth, the Commission has made the notice

requirement as simple as possible by providing model language for the notice in § 910.2(b)(4) and a safe harbor allowing employers to use a last known address and an exception for employers who do not have a workers' contact information. Employers can provide the notice by hand or through the mail, email, or a text message,[1269] and employers are not required to provide notice if they have no method of contacting a worker by paper or digital format.[1270] An employer is required only to notify workers that existing non-competes are no longer in effect and refrain from including non-competes in future contracts. This process is designed to be as easy as possible for employers. Employers should rarely need to seek outside legal assistance for complying with the notice requirement, and commenters do not provide an explanation of why legal assistance would be a necessary part of this process, though the cost of any such legal assistance (to identify senior executives for whom notice is not required) is accounted for in Part XI.F.1. Finally, the Commission will provide guidance materials for small entities to explain how to comply with the final rule.

The estimated compliance costs do not directly include any costs or savings from the senior executive exception, because the number of workers the exception might apply to is such a small portion of workers overall that any effect is *de minimis.* At an individual firm level, small businesses might not be impacted by the exception (if no workers earn above the total compensation threshold). Others might face increased compliance costs if they choose to use the exception and need to evaluate whether a worker meets the definition of senior executive (as accounted for in Part XI.F.1). However, the total compensation threshold included in the final rule's definition of ''senior executive'' is designed to ensure that employers and workers do not need to conduct a job duties assessment for every worker, only workers making above the threshold. In addition, in many cases it may be clear that a worker does or does not meet the test for whether a worker is a ''senior executive'' without a detailed assessment. For example, CEOs and Presidents are presumed to be in a policy-making position under § 910.1 and will not be otherwise subject to a job duties test, while highly paid workers in a non-executive role such as many physicians will not. Other small businesses might see decreased or eliminated direct and indirect compliance costs if they can maintain existing senior executive non-competes.

Many commenters also stated there are other indirect costs. SBA Advocacy suggested that the IRFA did not account for additional potential costs, including the costs of services, including higher legal fees to protect information, potential increased training, hiring and retention costs, and process changes.[1271] Similarly, a business association argued small businesses could face additional costs for finding alternatives to protect assets and to alter hiring, training, and retention processes. Some business associations argued that the cost of updating contractual practices would be higher because businesses would need to consult counsel, and many small businesses may be unable to afford to do so. A business organization stated that the Commission should consider the costs from a small business diminishing in value to potential buyers because it cannot record the value of its non-competes.

Another business organization said costs to small businesses are not limited to updating contractual agreements, mentioning the use of non-competes to protect assets and investments. A law firm suggested that trade secrets litigation often costs unspecified millions in attorney and expert fees and investigations costs. A business association commented that the rule would likely trigger additional litigation costs for trade secret protection and satisfying standards for injunctive relief, as well as unspecified additional costs related to lost business relationships and ideas. The business association cited an article from the biotech industry as saying a ban will force biotech companies to find other ways to protect themselves, likely through increased trade secret litigation, and recognizing that non-competes are critical to startups in the industry.

Two comments requested that the Commission publish a supplemental IRFA to account for the rule's potential impact.

The Commission notes that agencies are generally not required to consider indirect costs, though it is considered a best practice.[1272] While commenters raised categories of indirect costs that may be implicated (and it is not clear exactly what potential costs may fit into those categories), commenters did not provide any data or information that could enable the Commission to estimate any indirect costs. Some of these costs are also attenuated and speculative. Many of these concerns are also addressed in Parts IV.D and XI.C. The commenters also misunderstand the calculations in the IRFA and RIA; the estimates are an average across employers using non-competes, and there is likely to be substantial heterogeneity. The calculations account for the assumption that some firms may spend more than this amount. In response to comments on hiring costs, some firms may save on hiring costs from easier hiring, while others might have increased turnover costs.[1273] Businesses also have other options to compete on the merits besides raising wages, as many commenters indicated they sought jobs with better hours, more flexible schedules, shorter commutes, career opportunities, and other benefits.[1274] Businesses will be better able to hire workers experienced in their field who require less training than workers new to an industry.[1275]

Even if commenters' unsupported assertions that trade secret litigation and NDA enforcement may be more costly for businesses, including small businesses, are correct, such costs are justified by the benefits of the rule and in any event pecuniary benefits to a firm from an anticompetitive practice are not a cognizable justification.[1276] The Commission estimates that the final rule may increase or decrease overall litigation costs, and there is no evidence in the literature to allow the Commission to quantify those costs or benefits.[1277]

The comment citing an article on the biotech industry overstates the article's statements. The article said the existing increase in trade secrets litigation was likely to continue if the rule were adopted, did not cite any evidence for this prediction other than that non-competes are often used to protect trade secrets, and noted that companies may also use NDAs or restrict access to sensitive information.[1278] The article

Continued

did not say that non-competes are critical to biotech startups.[1279]

The commenter asking the Commission to consider small business valuation changes did not provide any potential estimates of such a cost, nor did the commenter demonstrate that such costs exist. It is unclear whether this commenter was referring to the value of non-competes for owners or for workers, but some such non-competes may fall within the exceptions for existing senior executive non-competes or for owners in a sale of business.[1280] To the extent there are any remaining non-competes that increase the value of a business in a sale, the Commission finds that any marginal decrease is justified by the substantial overall benefits of the rule.

In response to the requests for a supplemental IRFA, one is not required by law, and this FRFA responds to all comments on the IRFA. A supplemental IRFA would not provide the public with additional relevant information that the IRFA did not.

H. Discussion of Significant Alternatives

The RFA requires that agencies include a description of the steps the agency has taken to minimize the significant economic impact on small entities consistent with the stated objectives of applicable statutes, including a statement of the factual, policy, and legal reasons for selecting the alternative adopted in the final rule and why each one of the other significant alternatives to the rule considered by the agency which affect the impact on small entities was rejected.[1281] Statutory examples of ''significant alternatives'' include different requirements or timetables that take into account the resources available to small entities; the clarification, consolidation, or simplification of compliance and reporting requirements under the rule for small entities; the use of performance rather than design standards; and an exemption from coverage of the rule, or any part thereof, for small entities.[1282]

In Part IX, the Commission discusses significant alternatives to the final rule. Part IX also includes an assessment determining that each of the significant alternatives would not accomplish the objectives of the final rule. The Commission did incorporate some of the alternatives proposed in the NPRM and in comments into the final rule, namely the exception for existing senior executive non-competes, simplifying notice requirements, eliminating rescission requirements, and eliminating the 25% threshold for the sale of business exception. In addition, the Commission's analysis of benefits and costs in Part X includes an assessment of the benefits and costs of excluding senior executives. The Commission notes that it has designed the final rule to minimize compliance costs for all businesses and that the final rule does not include any reporting requirements. As stated in Part X.F.7.b, the Commission estimates that direct compliance costs and the costs of updating contractual practices would result in costs of $538.48 to $1,076.96 for each firm. As previously noted, the Commission does not believe the final rule imposes a significant economic impact on a substantial number of small entities. The Commission has also described how the final rule will benefit and increase the number of small businesses.

After careful consideration, the Commission is not creating an exception for small entities or different regulatory requirements for small entities. The final rule provides that for workers other than senior executives, it is an unfair method of competition for a person to enter into or attempt to enter into a non-compete, enforce or attempt to enforce a non-compete, or represent that the worker is subject to a non-compete.[1283] For senior executives, the final rule provides that it is an unfair method of competition for a person to enter into or attempt to enter into a non-compete, enforce or attempt to enforce a non-compete entered into after the effective date, or represent that the worker is subject to a non-compete, where the non-compete was entered into after the effective date.[1284] Based on the available evidence, the Commission does not believe that the analysis in Parts IV.B and IV.C is fundamentally different for non-competes that are imposed by small entities. For this reason, the Commission is not creating an exception for small entities or different regulatory requirements for small entities.

The Commission is not delaying the effective date of the final for small entities. Under § 910.6, the final rule is effective 120 days after publication in the **Federal Register** on September 4, 2024. One small business asked that the final rule's effective date be delayed for two years to give the business time to silo its intellectual property and implement safeguards to protect its information. In the Commission's view, the rule's effective date of September 4, 2024 will afford small entities a sufficient period of time to comply with the final rule, and commenters have not provided evidence that more time is necessary.[1285]

XII. Paperwork Reduction Act

Under the Paperwork Reduction Act of 1995 (''PRA''),[1286] Federal agencies must obtain approval from the Office of Management and Budget (''OMB'') for each collection of information they conduct or sponsor. The term ''collection of information'' includes any requirement or request for persons to obtain, maintain, retain, report, or publicly disclose information.[1287] Under the PRA, the Commission may not conduct or sponsor, and, notwithstanding any other provision of law, a person is not required to respond to, an information collection unless the information collection displays a valid control number assigned by OMB.[1288]

A. The Proposed Rule

In the NPRM, the Commission stated that it believed the proposed rule would contain a disclosure requirement that would constitute a collection of information requiring OMB approval under the PRA. The Commission stated that this disclosure requirement was proposed § 910.2(b)(2), which would have required employers to provide notice to a worker with an existing non-compete—*i.e.,* a non-compete that was entered into prior to the effective date—that the non-compete is no longer in effect and may not be enforced against the worker.[1289] Conservatively assuming that each establishment must engage in its own communication—*i.e.,* a firm's headquarters does not have the ability to send a company-wide email, for example—the Commission estimated that covered employers would incur an estimated labor cost burden of 1,310,747 hours to comply with this requirement (3,932,240 establishments × 20 minutes). The Commission estimated the associated labor cost for notifying affected workers who are already employed is $9.98 × 7.96 million × 0.494 = $39,243,755.[1290]

The Commission stated that the proposed rule would impose only *de minimis* capital and non-labor costs.

[1290] *Id.* at 3534.

The Commission anticipated that covered employers would already have in place existing systems to communicate with and provide employment-related disclosures to workers. While the proposed rule would require a one-time disclosure to some workers subject to a rescinded non-compete, the Commission anticipated that this one-time disclosure would not require substantial investments in new systems or other non-labor costs. The Commission noted that, moreover, many establishments are likely to provide the disclosure electronically, further reducing total costs.[1291]

The Commission sought comment on all aspects of its PRA analysis, including (1) whether the proposed collection of information is necessary for the proper performance of the functions of the agency, including whether the information would have practical utility; (2) the accuracy of the agency's estimate of the burden of the proposed collection of information, including the validity of the methodology and assumptions used; (3) ways to enhance the quality, utility, and clarity of the information to be collected; and (4) ways to minimize the burden of these information collections on respondents.

B. Comments Received

No commenters specifically addressed the PRA analysis in the NPRM. However, the Commission received extensive comments on its Preliminary Regulatory Impact Analysis and Initial Regulatory Flexibility Act Analysis, and many of these commenters addressed the Commission's estimates related to the cost of compliance. These comments are summarized in Parts X (the Commission's Final Regulatory Analysis) and XI (the Commission's Final Regulatory Flexibility Act Analysis). The Commission also received comments on the proposed notice requirement itself. These comments are summarized in Part IV.E.

C. Final PRA Analysis

The Commission finalizes the proposed rule's notice requirement largely as proposed, with some adjustments to even further ease compliance. In the final rule, § 910.2(a)(1)(ii) prohibits employers from enforcing existing non-competes—*i.e.,* non-competes entered into prior to the effective date—with respect to workers other than senior executives. Section 910.2(b)(1) as finalized states further that for each existing non-compete that it is an unfair method of competition to enforce or attempt to enforce under § 910.2(a)(1)(ii)—*i.e.,* non-competes entered into with workers other than senior executives—the person who entered into the non-compete with the worker must provide clear and conspicuous notice to the worker by the effective date that the worker's non-compete will not be, and cannot legally be, enforced against the worker.

Pursuant to § 910.2(b)(2), the notice must (i) identify the person who entered into the non-compete with the worker and (ii) be on paper delivered by hand to the worker, or by mail at the worker's last known personal street address, or by email at an email address belonging to the worker, including the worker's current work email address or last known personal email address, or by text message at a mobile telephone number belonging to the worker.

Section 910.2(b)(3) provides an exception to the notice requirement in § 910.2(b)(1) where the person that would otherwise be required to provide the notice has no record of a street address, email address, or mobile telephone number.

Section 910.2(b)(4) provides model language that employers may use to comply with the notice requirement. Section 910.2(b)(5) states that an employer presumptively complies with the notice requirement in § 910.2(b)(1) where the employer provides a notice to the worker pursuant to § 910.2(b)(4). And § 910.2(b)(6) allows but does not require employers, in addition to providing the required notice in English, to provide the notice in another language (or languages). Section 910.2(b)(6) also permits employers to use any Commission-provided translation of the model language in § 910.2(b)(4).

The notice requirement has changed in two important respects from the proposed rule. First, employers are no longer required to provide the notice to senior executives with existing non-competes. Second, as long as employers provide the notice in English, they are permitted to provide the notice in a language other than English. However, neither of these changes significantly affects the burden of complying with the notice. Senior executives are only 0.75% of workers, so the cost savings to employers of not needing to provide the notice to senior executives are minimal. No employer is required to provide the notice in a different language, so the rule does not require employers to incur any compliance costs for doing so.

The Commission estimates that composing and sending the notice in a digital format to workers for whom digital contact information is available would take 20 minutes of a human resources specialist's time. According to BLS, the median wage for a human resources specialist in 2022 was $31.85 per hour in 2023 dollars.[1292] The cost of compliance for currently employed workers is therefore ($31.85*2)/3=$21.23 per establishment.[1293] According to the Census Bureau's Statistics of U.S. Businesses database, in 2021 (the most recent year for which data are available), there were 5.91 million firms and 6.88 million establishments in the U.S.[1294] The Commission estimates the percentage of firms using non-competes in the U.S. at 49.4%.[1295] The Commission conservatively assumes that each establishment must engage in its own communication—*i.e.,* that a firm's headquarters does not have the ability to send a company-wide email, for example. This yields an estimated 3,397,545 covered establishments which would incur an estimated labor cost burden of 1,132,515 hours to comply with this requirement (3,397,545 establishments × 20 minutes). The Commission estimates the associated labor cost for notifying affected workers who are already employed and for whom digital contact information is available is $21.23 × 6.88 million × 0.494 = $72,141,201.

Businesses may not have digital contact information for workers. The number of workers with non-competes who must therefore receive physical notice is the total number of covered workers (101.1 million; see Part X.F.7.a.i) times the percentage of workers who have non-competes (18.1%) times the percentage of workers who require mailed notice (assumed to be 66% of workers [1296]), for a total of 12.1 million workers. The Commission notes that the percentage of workers who require mailed notice is likely a substantial overestimate, since it is estimated based on the percentage of individuals who receive health information digitally. The Commission believes that employers are more likely to have digital means of providing the notice to their current workers

[1291] *Id.*

[1292] BLS, *Occupational Outlook Handbook: Human Resources Specialists, https://www.bls.gov/ooh/business-and-financial/human-resources-specialists.htm.* The value in 2022 was $30.88, which was updated to 2023 dollars.

[1293] The lost productivity of workers is assumed to be twice the median wage. *See* Part X.F.7.b.ii.

[1294] Census Bureau, *2021 SUSB Annual Data Tables by Establishment Industry* (December 2023), *https://www.census.gov/data/tables/2021/econ/susb/2021-susb-annual.html.*

[1295] *See* Colvin & Shierholz, *supra* note 65 at 4.

[1296] *See supra* note 1165 (CMS Supporting Statement assumes 66% of workers require mailed notice from their health insurance companies).

especially, but also to their former workers. The Commission conservatively adopts this estimate as an upper bound. The cost of mailed notice provision includes some capital costs (the cost of postage and mailing materials) and the cost of a human resource professional's time. The cost per worker is estimated as 5 cents for one printed page plus mailing cost of 70 cents plus the cost of one minute of an HR professional's time, at $63.70 per hour, for a total of $1.81 per notice. The overall cost of mailed notice provision is therefore estimated to be $22 million.

As the Commission stated in the proposed rule, the Commission anticipates that covered employers already have in place existing systems to communicate with and provide employment-related disclosures to workers. While the final rule requires a one-time disclosure to some workers, the Commission anticipates this one-time disclosure will not require substantial investments in new systems or other non-labor costs. Moreover, many establishments are likely to provide the disclosure electronically, further reducing total costs.

XIII. Other Matters

Pursuant to the Congressional Review Act (5 U.S.C. 801 *et seq.*), the Office of Information and Regulatory Affairs designated this final rule as a ''major rule,'' as defined by 5 U.S.C. 804(2).

List of Subjects in 16 CFR Part 910

Antitrust.

■ For the reasons set forth above, and under the authority of Sections 5 and 6(g) of the Federal Trade Commission Act, the Federal Trade Commission adds subchapter J, consisting of parts 910 and 912, to chapter I in title 16 of the Code of Federal Regulations to read as follows:

Subchapter J—Rules Concerning Unfair Methods of Competition

PART 910—NON-COMPETE CLAUSES

PART 912—[RESERVED]

PART 910—NON-COMPETE CLAUSES

Sec.

Authority: 15 U.S.C. 45 and 46(g).

PART 910—NON-COMPETE CLAUSES

§ 910.1 Definitions.

As used in this part:

Business entity means a partnership, corporation, association, limited liability company, or other legal entity, or a division or subsidiary thereof.

Employment means work for a person.

Non-compete clause means:

(1) A term or condition of employment that prohibits a worker from, penalizes a worker for, or functions to prevent a worker from:

(i) Seeking or accepting work in the United States with a different person where such work would begin after the conclusion of the employment that includes the term or condition; or

(ii) Operating a business in the United States after the conclusion of the employment that includes the term or condition.

(2) For the purposes of this part, term or condition of employment includes, but is not limited to, a contractual term or workplace policy, whether written or oral.

Officer means a president, vice president, secretary, treasurer or principal financial officer, comptroller or principal accounting officer, and any natural person routinely performing corresponding functions with respect to any business entity whether incorporated or unincorporated.

Person means any natural person, partnership, corporation, association, or other legal entity within the Commission's jurisdiction, including any person acting under color or authority of State law.

Policy-making authority means final authority to make policy decisions that control significant aspects of a business entity or common enterprise and does not include authority limited to advising or exerting influence over such policy decisions or having final authority to make policy decisions for only a subsidiary of or affiliate of a common enterprise.

Policy-making position means a business entity's president, chief executive officer or the equivalent, any other officer of a business entity who has policy-making authority, or any other natural person who has policy-making authority for the business entity similar to an officer with policy-making authority. An officer of a subsidiary or affiliate of a business entity that is part of a common enterprise who has policy-making authority for the common enterprise may be deemed to have a policy-making position for purposes of this paragraph. A natural person who does not have policy-making authority over a common enterprise may not be deemed to have a policy-making position even if the person has policy-making authority over a subsidiary or affiliate of a business entity that is part of the common enterprise.

Preceding year means a person's choice among the following time periods: the most recent 52-week year, the most recent calendar year, the most recent fiscal year, or the most recent anniversary of hire year.

Senior executive means a worker who:

(1) Was in a policy-making position; and

(2) Received from a person for the employment:

(i) Total annual compensation of at least $151,164 in the preceding year; or

(ii) Total compensation of at least $151,164 when annualized if the worker was employed during only part of the preceding year; or

(iii) Total compensation of at least $151,164 when annualized in the preceding year prior to the worker's departure if the worker departed from employment prior to the preceding year and the worker is subject to a non-compete clause.

Total annual compensation is based on the worker's earnings over the preceding year. Total annual compensation may include salary, commissions, nondiscretionary bonuses and other nondiscretionary compensation earned during that 52-week period. Total annual compensation does not include board, lodging and other facilities as defined in 29 CFR 541.606, and does not include payments for medical insurance, payments for life insurance, contributions to retirement plans and the cost of other similar fringe benefits.

Worker means a natural person who works or who previously worked, whether paid or unpaid, without regard to the worker's title or the worker's status under any other State or Federal laws, including, but not limited to, whether the worker is an employee, independent contractor, extern, intern, volunteer, apprentice, or a sole proprietor who provides a service to a person. The term worker includes a natural person who works for a franchisee or franchisor, but does not include a franchisee in the context of a franchisee-franchisor relationship.

§ 910.2 Unfair methods of competition.

(a) *Unfair methods of competition*—(1) *Workers other than senior executives.* With respect to a worker other than a senior executive, it is an unfair method of competition for a person:

(i) To enter into or attempt to enter into a non-compete clause;

(ii) To enforce or attempt to enforce a non-compete clause; or

(iii) To represent that the worker is subject to a non-compete clause.

(2) *Senior executives.* With respect to a senior executive, it is an unfair method of competition for a person:

(i) To enter into or attempt to enter into a non-compete clause;

(ii) To enforce or attempt to enforce a non-compete clause entered into after the effective date; or

(iii) To represent that the senior executive is subject to a non-compete clause, where the non-compete clause was entered into after the effective date.

(b) *Notice requirement for existing non-compete clauses*—(1) *Notice required.* For each existing non-compete clause that it is an unfair method of competition to enforce or attempt to enforce under paragraph (a)(1)(ii) of this section, the person who entered into the non-compete clause with the worker must provide clear and conspicuous notice to the worker by the effective date that the worker's non-compete clause will not be, and cannot legally be, enforced against the worker.

(2) *Form of notice.* The notice to the worker required by paragraph (b)(1) of this section must:

(i) Identify the person who entered into the non-compete clause with the worker;

(ii) Be on paper delivered by hand to the worker, or by mail at the worker's last known personal street address, or by email at an email address belonging to the worker, including the worker's current work email address or last known personal email address, or by text message at a mobile telephone number belonging to the worker.

(3) *Exception.* If a person that is required to provide notice under paragraph (b)(1) of this section has no record of a street address, email address, or mobile telephone number, such person is exempt from the notice requirement in paragraph (b)(1) of this section with respect to such worker.

(4) *Model language.* For purposes of paragraph (b)(1) of this section, the following model language constitutes notice to the worker that the worker's non-compete clause cannot legally be enforced and will not be enforced against the worker.

BILLING CODE 6750–01–P

Figure 1 to Paragraph (b)(4)—Model Language

A new rule enforced by the Federal Trade Commission makes it unlawful for us to enforce a non-compete clause. As of [DATE EMPLOYER CHOOSES BUT NO LATER THAN EFFECTIVE DATE OF THE FINAL RULE], [EMPLOYER NAME] will not enforce any non-compete clause against you. This means that as of [DATE EMPLOYER CHOOSES BUT NO LATER THAN EFFECTIVE DATE OF THE FINAL RULE]:

- You may seek or accept a job with any company or any person—even if they compete with [EMPLOYER NAME].
- You may run your own business—even if it competes with [EMPLOYER NAME].
- You may compete with [EMPLOYER NAME] following your employment with [EMPLOYER NAME].

The FTC's new rule does not affect any other terms or conditions of your employment. For more information about the rule, visit [*link to final rule landing page*]. Complete and accurate translations of the notice in certain languages other than English, including Spanish, Chinese, Arabic, Vietnamese, Tagalog, and Korean, are available at [URL on FTC's website].

BILLING CODE 6750–01–C

(5) *Safe harbor.* A person complies with the requirement in paragraph (b)(1) of this section if the person provides notice to a worker pursuant to paragraph (b)(4) of this section.

(6) *Optional notice in additional languages.* In addition to providing the notice required in paragraph (b)(1) of this section in English, a person is permitted to provide such notice in a language (or in languages) other than English or to include internet links to translations in additional languages. If providing optional notice under this paragraph (b)(6), a person may use any Commission-provided translation of the model language in paragraph (b)(4) of this section.

§ 910.3 Exceptions.

(a) *Bona fide sales of business.* The requirements of this part shall not apply to a non-compete clause that is entered into by a person pursuant to a bona fide sale of a business entity, of the person's ownership interest in a business entity, or of all or substantially all of a business entity's operating assets.

(b) *Existing causes of action.* The requirements of this part do not apply where a cause of action related to a non-compete clause accrued prior to the effective date.

(c) *Good faith.* It is not an unfair method of competition to enforce or attempt to enforce a non-compete clause or to make representations about a non-compete clause where a person has a good-faith basis to believe that this part is inapplicable.

§ 910.4 Relation to State laws and preservation of State authority and private rights of action.

(a) This part will not be construed to annul, or exempt any person from complying with any State statute,

regulation, order, or interpretation applicable to a non-compete clause, including, but not limited to, State antitrust and consumer protection laws and State common law, except that this part supersedes such laws to the extent, and only to the extent, that such laws would otherwise permit or authorize a person to engage in conduct that is an unfair method of competition under § 910.2(a) or conflict with the notice requirement in § 910.2(b).

(b) Except with respect to laws superseded under paragraph (a) of this section, no provision of this part shall be construed as altering, limiting, or affecting the authority of a State attorney general or any other regulatory or enforcement agency or entity or the rights of a person to bring a claim or regulatory action arising under any State statute, regulation, order, or interpretation, including, but not limited to, State antitrust and consumer protection laws and State common law.

§ 910.5 Severability.

If any provision of this part is held to be invalid or unenforceable by its terms, or as applied to any person or circumstance, or stayed pending further agency action, the provision shall be construed so as to continue to give the maximum effect to the provision permitted by law and such invalidity shall not affect the application of the provision to other persons or circumstances or the validity or application of other provisions. If any provision or application of this part is held to be invalid or unenforceable, the provision or application shall be severable from this part and shall not affect the remainder thereof.

§ 910.6 Effective date.

This part is effective September 4, 2024.

PART 912—[RESERVED]

By direction of the Commission, Commissioners Holyoak and Ferguson dissenting.

April J. Tabor,

Secretary.

Note: The following appendix will not appear in the Code of Federal Regulations.

APPENDIX A—TABLE A.1

APPENDIX A—TABLE A.1—Continued

State	Estimated number of covered workers	Estimated increase in total annual worker earnings	Estimated increase in average annual worker earnings
Washington	2,809,814	2,090,953,114	744
West Virginia	539,026	253,817,680	471
Wisconsin	2,301,874	1,207,149,373	524
Wyoming	217,787	108,650,236	499
Full US, excluding CA, ND, OK, MN	101,785,552	53,291,058,349	524

Note: The estimated number of covered workers is calculated as 80% * (total employed population in the state); the estimated increase in total earnings is calculated as 0.86% * (estimated total covered earnings), where estimated total covered earnings is calculated as (estimated number of covered workers) * (average annual earnings); and the estimated increase in average earnings is calculated as 0.86% * (average annual earnings). Total employed population and average annual earnings are taken from the U.S. Census Bureau Quarterly Census of Employment and Wages for 2022 (see *https://www.bls.gov/cew/data.htm*). National totals may not equal the sum of state-specific estimates due to rounding.

[FR Doc. 2024–09171 Filed 4–30–24; 8:45 am]

BILLING CODE 6750–01–P

Federal Trade Commission

600 Pennsylvania Avenue NW | Washington, D.C. 20580 | ftc.gov

Fact Sheet on the FTC's Noncompete Rulemaking

On April 23, 2024, the FTC voted to finalize a new rule to prohibit employers from enforcing noncompetes against workers.

- The Commission determined that noncompetes are an unfair method of competition and therefore violate Section 5 of the Federal Trade Commission Act ("FTC Act").
- The final rule prohibits employers from entering into new noncompetes with workers on or after the effective date. The rule also prohibits employers from enforcing existing noncompetes with workers other than senior executives.
- The rule is set to go into effect on September 4, 2024.

Noncompetes restrict the freedom of American workers and suppress wages.

- Noncompetes restrict workers' fundamental freedom to leave for a better job or to start their own business.
- In many cases, noncompetes are take-it-or-leave-it contracts that exploit workers' lack of bargaining power and coerce workers into staying in jobs they would rather leave, or force workers to leave a profession or even relocate.
- By restricting workers from moving freely, noncompetes prevent workers from accepting higher-paying jobs.
- Noncompetes even reduce the wages of workers who aren't subject to noncompetes.

Noncompetes stifle new businesses and new ideas.

- Noncompetes prevent workers from starting their own firms and block new businesses from hiring qualified workers.
- Noncompetes restrict the flow of knowledge between firms, and studies have found that noncompetes reduce innovation. This affects not just workers but also consumers by

depriving consumers of better products and lower prices that result from competition and innovation.

Noncompetes are widespread throughout the U.S. economy.

- Roughly one in five Americans, totaling nearly **30 million people**, are subject to noncompetes.
- The Commission received over **26,000 comments**, with thousands of workers describing how noncompetes blocked them from taking a better job, negotiating better pay, or starting their own business.
- The Commission also heard from entrepreneurs and small businesses who said noncompetes prevented them from starting new ventures or hiring knowledgeable workers to help grow their businesses.

By banning noncompetes, the FTC estimates that:

- Over **25,000 commenters** supported a categorical ban on noncompetes.
- New business formation will grow by **2.7%**, creating over **8,500 new businesses** each year.
- American workers' earnings will increase by **$400-$488 billion** over the next decade, with workers' earnings rising an estimated **$524** a year on average.
- Health care costs will be reduced by **$74-$194 billion** over the next decade in reduced spending on physician services.
- Innovation will increase, with an average estimated increase of **17,000-29,000** more patents each year over the next decade.

The Noncompete Rule

- **The rule states that noncompetes are an unfair method of competition**.
    - As a result, the rule prohibits employers from entering into new noncompetes with workers as of the effective date, set to be on September 4, 2024.
- **The rule prohibits employers from enforcing noncompetes with workers other than senior executives as of the effective date, set to be on September 4, 2024.**
    - Less than 1% of workers are estimated to be senior executives under the final rule.
    - Specifically, the final rule defines the term "senior executive" as workers earning more than $151,164 who are in a "policy-making position."

- **The rule requires employers to notify workers whose noncompetes are no longer enforceable that their noncompetes are no longer in effect and will not be enforced.**
    - The FTC provides model language that employers can use to notify employees.

- **The rule includes an exception that allows noncompetes between the seller and buyer of a business.**

- **The final rule differs from the proposed rule in several respects**.
    - The rule does not ban existing noncompetes with senior executives.
    - The rule simplifies the notice and compliance requirements for employers.
    - The rule expands the sale of business exception.

How to Report a Violation of the Noncompete Rule

- Once the rule becomes effective, set to be on September 4, 2024, you can submit information about a suspected violation of the rule to the Bureau of Competition by sending an email to noncompete@ftc.gov.

- Complaints may also be sent by mail to:
  Office of Policy and Coordination
  Bureau of Competition
  Federal Trade Commission
  600 Pennsylvania Avenue, NW
  Washington, DC 20580

Please note that the FTC cannot provide legal advice, take action on behalf of private individuals, or answer questions about its investigations.

- NOTE: Confidential information should be marked “Confidential” and sent via regular mail. To learn how we may use the information you provide, please read our Privacy Policy.

- RESPONSES: All incoming messages are forwarded to the appropriate division within the Bureau of Competition. The FTC may use these reports to investigate and bring enforcement actions for violations of the rule, but it can’t respond to each message or resolve reports on behalf of individuals.

August 22, 2024

Texas Federal Judge Blocks FTC Non-Compete Ban

Sean Gallagher, Scott Gilbert, Arindam Kar, Eric Packel, Emma Schuering, Jason Weber, Ross Weimer

Polsinelli

This week, Judge Ada E. Brown of the U.S. District Court for the Northern District of Texas in *Ryan v. The Federal Trade Commission* upheld a challenge by business groups to the FTC's non-compete ban. In addition to confirming her earlier ruling that the FTC non-compete ban was not a valid exercise of agency power, the judge also expanded the limited, temporary injunction entered on July 3, 2024 to hold unlawful and set aside the noncompete-ban in a ruling with a "nationwide effect" that is not limited to the parties in the lawsuit. In other words, **the FTC's non-compete ban will not take effect on September 4 for anyone.**

The Court concluded that: (1) the FTC lacked statutory authority to promulgate substantive rules concerning unfair methods of competition, *i.e.* the non-compete ban; and (2) the non-compete ban is arbitrary and capricious because it is "unreasonably overbroad without a reasonable explanation." As a result, the Court found the non-compete ban to be an unlawful agency action. In deciding the appropriate relief, the Court relied on recent precedent from the Fifth Circuit to conclude its ruling must have a "'nationwide effect,' is 'not party-restricted,' and 'affects persons in all judicial districts equally.'" Thus, the Court's ruling prevents (1) the FTC from taking *any* action to enforce the non-compete ban against *anyone*; and (2) the FTC non-compete ban from taking effect on September 4, 2024—effectively vacating it.

What happens next? In the wake of the ruling, the FTC's spokesperson stated, "[The FTC is] seriously considering a potential appeal." If the FTC decides to appeal, the decision would be reviewed by the U.S. Court of Appeals for the Fifth Circuit in New Orleans. Any decision rendered by the Fifth Circuit would likely be appealed to the U.S. Supreme Court—meaning the final fate of the FTC's non-compete will be revisited and could change.

Importantly, even though the FTC non-compete ban will likely not go into effect in the immediate future, the FTC still has the power in the interim under Section 5 of the FTC Act to pursue enforcement actions on a case-by-case basis. In reacting to the ruling, an FTC spokesperson stated, "Today's decision does not prevent the FTC from addressing noncompetes through case-by-case enforcement actions." If the FTC is to be taken at its word, it appears ready to amplify such enforcement actions in the future. The FTC's posture could change after the November election depending upon the policies of the next administration.

How should employers approach non-competes? Notwithstanding this week's ruling, employers should still be mindful of the enforceability of their non-competes now and in the future. Several states have limited or outright banned the use of non-competes. The move by the FTC could spark additional state legislatures to revisit state-level restrictions as they return from recess and begin new legislative sessions this Fall. The U.S. Congress could also decide to enact legislation of its own; and, it's conceivable that this week's ruling will serve as a catalyst for Congress to revisit such legislation.

Polsinelli attorneys are continually monitoring the evolving landscape of restrictive covenant law.

COLLECTIVE

THE STATE OF THE

Direct Care Workforce

2025 REPORT

2119

Executive Summary

The direct care workforce is in urgent need of attention. Over half of direct care workers (DCWs) rely on public assistance, and they face anxiety and depression at three times the national average. Home care workers often experience social isolation, further impacting their well-being.

Although other professions offer higher wages, many DCWs are drawn to caregiving by a profound sense of purpose and mission. However, their primary interactions are often with recruiters or schedulers, leading to a disconnection from their employers. This lack of direct engagement fosters mistrust, while providers contend with high turnover, workforce shortages, and regulatory pressures.

These issues have significant consequences: families increasingly struggle to access necessary care, a problem set to escalate as the population ages.

We must act decisively. Supporting our direct care workforce is essential for delivering high-quality care and achieving optimal outcomes. A healthy workforce benefits the ecosystem.

MissionCare COLLECTIVE

BRANDI KURTYKA
CEO, MissionCare Collective

The Workforce Why

For many direct care workers, caregiving transcends the boundaries of a mere job. It is a profound calling driven by a deep-seated desire to positively impact the lives of those they assist. This role goes beyond providing basic help; it involves building meaningful connections, sharing in the narratives of their clients, and becoming an essential part of their journey. Each day brings a new opportunity to make a difference, to touch lives, and to be touched in return. The role offers unparalleled freedom, not just through daily routines but through the rewarding experience of witnessing the direct impact of their service. Motivated by an unwavering passion, these caregivers embody the essence of true service, showcasing the immense power of compassion, commitment, and human connection.

> Each day brings a new opportunity to make a difference, to touch lives, and to be touched in return.

Struggling Financially

Juggling multiple jobs to make ends meet, often needing to work outside of care to pay bills.

2125

21%
of direct care workers self report poor mental health.[3]

Emotional Health

The emotional health of direct care workers (DCWs) is a significant concern, with 21% reporting poor mental health. DCWs are three times more likely to struggle with anxiety and depression. Financial instability, with many being single mothers juggling multiple jobs, further compounds these issues. Role misunderstandings and expectations to perform tasks beyond their training, often being mistaken for housekeepers, add to their stress. Working in unfamiliar and potentially unsafe environments exposes them to risks like drug activity, violence, and sexual assault. Social isolation from working in the homes of those they care for, coupled with the high physical and emotional demands of the job, leads to elevated stress levels.

Pipeline Expansion

In a comprehensive study of 67,000 direct care workers, seven distinct personas were identified that illuminate their diverse motivations and workplace values. Each persona represents a unique opportunity for recruitment pipeline expansion and workforce stabilization. The report offers targeted strategies to reduce turnover, incentivize staff effectively, and optimize recruitment efforts. It also provides practical engagement tips and career pathway considerations, serving as a crucial resource for healthcare organizations aiming to attract and retain a dedicated workforce.

Career Caregivers

Spanning various ages and with over 3 years of professional experience, they typically work exclusively within the care field. Most often seeking full-time hours, ensuring a strong client match is of utmost importance.

Caring on the Siders

Middle-aged women, often without children, working hourly jobs. They are transient in their work, heavy internet users, and enjoy donating to liberal and cultural causes. They also have a passion for R&B music.

Young and on the Move

Young adults, aged 18-24, a mix of students and working professionals. Living on a limited income and unlikely to have children, they seek jobs that allow for personal growth that don't interfere, but enhance their lifestyle.

2136

Single Moving Mommas

Single moms who move frequently, have below-average discretionary income, and are most likely renting. They value discount stores and often worry about making ends meet and lack of job flexibility.

Still Going Strong Retirees

Females in their 60s who enjoy spending time with their grandchildren and getting out of the house. Living on a limited income, they are somewhat concerned about having enough money to retire.

Oodles of Offspring

Young female households with multiple children, comprising a mix of renters and homeowners with limited income. They prioritize family over work and enjoy spending time and money on their kids.

Empty Nesters

Young or near-retirees who enjoy spending time with their grandchildren, watching daytime television, and sewing. Living on a limited income, they love helping others and getting out of the house.

Genworth Cost of Care Survey 2023

Summary and Methodology

131168 07/11/24

Genworth®

Summary of 2023 Survey Findings

To help families plan for potential long-term care needs, Genworth has conducted its Cost of Care Survey since 2004. This comprehensive data-gathering effort compiles current rates charged by long-term care service providers across all 50 states and makes them easily accessible through an interactive digital tool on Genworth's website.

Following the 2021 survey, the United States continued to grapple with the COVID-19 pandemic, and we saw shifts in the long-term care space. Genworth made the decision to recalibrate our Cost of Care Survey and methodology to align with consumer needs and the current state of the industry.

Keeping the best of the past with a fresh lens for the future, we share the key findings of Genworth's Cost of Care Survey 2023.

Cost of care

The national median costs associated with all long-term care service providers increased in 2023. From 2021 to 2023, Assisted Living Facilities have increased an average of 18.89%, but the increase from 2022 to 2023 was only 1.36%. The annual national median for a private, one-bedroom arrangement at these facilities reported to be $64,200 a year in 2023. The national median cost for a private, one bedroom in a Nursing Home is $116,800 a year and a semi-private room is $104,025 a year, representing average increases of 4.92% and 4.40%, respectively since 2022. The national median price of Adult Day Services increased an average 5.56% since 2022, reportedly costing $95 a day in 2023.

The 2023 Cost of Care data reveals high year-over-year increases in homecare services which includes both homemaker services – assistance with "hands off" everyday tasks such as cooking, cleaning, etc. and general companionship – as well as home health aides who provide "hands on" assistance with activities like bathing, eating, and getting dressed. The reported national median cost in 2023 for homemaker services is $30 per hour and $33 per hour for home health aide services, although significant variance exists across regions and actual pricing depends on the severity of one's need. These prices represent an average increase of 10.00% and 7.14%, respectively, year-over-year compared to the 2022 dataset. If we compare that to our 2021 survey, the hourly cost for homemaker services has risen by 15.38% and home health aide services have risen by 22.22%.

Cost Drivers

Inflation and a shortage of workers are seen as equal contributors to the increases in long-term care costs. Inflation was the number one driver for assisted living facilities and adult day care, while worker shortages was the number one driver for home care and nursing homes.

Person-Centered Care

This year's survey included a new focus on person-centered care. Person-centered care is safe, high-quality health care that puts a high value on respecting and responding to the preferences, needs and values of patients and their families. **All respondents, regardless of facility type, said the idea of person-centered care was very important to them.** The top barriers that impact the ability to offer person-centered care are staff training and cost.

The following report provides additional details around the 2023 national median rates for the various types of care settings as well as the methodology used for the survey.[1]

Genworth Cost of Care Survey 2023 | **Summary**

HOME

Homemaker Services: Services providing help with household tasks that cannot be managed alone. Homemaker services includes "hands-off" care such as cooking, cleaning and running errands.

NATIONAL MEDIAN HOURLY RATE 2023	NATIONAL MEDIAN HOURLY RATE 2022	YEAR-OVER-YEAR PERCENT CHANGE
$30	$28	7.14%

Home Health Aide Services: Home health aides offer services to people who need more extensive care. It is "hands-on" personal care, but not medical care. The rate listed here is the rate charged by a non-Medicare certified, licensed agency.

NATIONAL MEDIAN HOURLY RATE 2023	NATIONAL MEDIAN HOURLY RATE 2022	YEAR-OVER-YEAR PERCENT CHANGE
$33	$30	10%

COMMUNITY

Adult Day Health Care (ADC): Provides social and support services in a community-based, protective setting. Various models are designed to offer socialization, supervision and structured activities. Some programs may provide personal care, transportation, medication management and meals.

NATIONAL MEDIAN DAILY RATE 2023	NATIONAL MEDIAN DAILY RATE 2022	YEAR-OVER-YEAR PERCENT CHANGE
$95	$90	5.56%

Assisted Living Facility (ALF): Residential arrangements providing personal care and health services. The level of care may not be as extensive as that of a nursing home. Assisted living is often an alternative to a nursing home, or an intermediate level of long term care.

NATIONAL MEDIAN MONTHLY RATE 2023	NATIONAL MEDIAN MONTHLY RATE 2022	YEAR-OVER-YEAR PERCENT CHANGE
$5,350	$5,278	1.36%

FACILITY

Nursing Home Care: These facilities often provide a higher level of supervision and care than Assisted Living Facilities. They offer residents personal care assistance, room and board, supervision, medication, therapies and rehabilitation, and on-site nursing care 24 hours a day.

Semi-Private Room

NATIONAL MEDIAN DAILY RATE 2023	NATIONAL MEDIAN DAILY RATE 2022	YEAR-OVER-YEAR PERCENT CHANGE
$285	$273	4.40%

Private Room

NATIONAL MEDIAN DAILY RATE 2023	NATIONAL MEDIAN DAILY RATE 2022	YEAR-OVER-YEAR PERCENT CHANGE
$320	$305	4.92%

Methodology

About

This year, 176,807 providers were contacted resulting in 11,867 completed surveys of nursing homes, assisted living facilities, adult day health facilities and home care providers. Potential respondents were selected from CareScout's nationwide database of providers, supplemented with additional providers in each category of long-term care services. CareScout is a wholly owned subsidiary of Genworth Financial, Inc. that helps older adults and their families navigate the aging journey and find quality care.

Respondents representing all 50 states and the District of Columbia completed the survey by either phone or online between September and December 2023. Survey respondents were informed that the survey data provided would be included in the Genworth Cost of Care Survey 2023 results. Rates were collected for 2023 and 2022, and survey questions varied based on the type of care provided.

One of the most comprehensive surveys of its kind, the Genworth Cost of Care Survey publishes costs in 429 regions based on 382 U.S. Metropolitan Statistical Areas (MSAs). MSA definitions are established by the U.S. Office of Management and Budget. The survey also includes some counties outside of the MSA regions. Data collection attempted for all provider types in all regions, the following results in this document represent the number of regions where data collection was successful.

Home Care (HC)[2]

Surveyors completed 3,593 interviews with licensed home health care providers representing 18 percent of home care agencies.[3] The agencies surveyed provided home health care and homemaker services where a skilled nurse does not need to be present. A home health aide will typically help with bathing, dressing, transferring and toileting, but not with catheters or injections. Most of these agencies also provide homemaker services that typically include assistance with shopping, finances, cooking, errands and transportation. Homemaker services may also be employed for the purpose of providing companionship.

Annual rates are based on 44 hours of care per week, multiplied by 52 weeks. Where a rate range was provided, the midpoint was used. The survey excludes holiday rates.

Adult Day Health Care (ADC)

Surveyors polled 6 percent of adult day health care facilities, resulting in 600 completed surveys. ADC is designed to meet the needs of adults who are functionally and/or severely cognitively impaired. Programs are intended to be structured and comprehensive, and to take place in a protective setting that promotes well-being through a variety of health, social and other support services. These services are intended to help enable individuals live more independently in the community and may also be used to provide relief for family caregivers.

[2] Various provider categories used in the survey may not be the same as the definitions used in a long term care insurance policy.

[3] Not all states require a license for home care. Data includes certain states where unlicensed providers are included because the state does not offer or does not have HH license requirements.

ADC facility rates are structured in a variety of ways: Some charge by the hour, some by the half-day and others for the full day, regardless of utilization. All rates used in Genworth's survey were extrapolated to a daily (6–8 hours) rate.

ADC facility rates may be subsidized by the government or the community. A government subsidy is based on the individual's ability to pay. However, a community subsidy is available to individuals regardless of their income level. This survey captures the full private pay rates or, where applicable, the community subsidy rates. This survey does not capture the government subsidy rates.

Annual rates are based on the daily rate multiplied by five days per week, then multiplied by 52 weeks.

Assisted Living Facilities (ALF)[4]

Surveyors polled 15 percent of licensed assisted living facilities, resulting in 3,739 completed surveys. Surveyors also determined whether the facility charges a non-refundable community or entrance fee. This study shows that approximately 61 percent of assisted living facilities charge a one-time, non-refundable fee.

Unlike nursing homes, there is no uniform regulatory standard for assisted living facilities. As a consequence, states have instituted licensing standards that vary from state to state. The assisted living facilities polled were licensed according to the licensure requirements of the state in which the assisted living facility was located.

Currently, there are more than 70 different names or designations for facilities licensed as some form of an assisted care facility. Generally, fewer than 40 percent of these care facilities use the term "assisted living facility" as a part of their formal name or licensure designation. For example, some facilities may be identified as "residential care facilities." Because of variations in licensing requirements by state, both small group homes and large multi-service facilities qualified as assisted living facilities for the purposes of this study.

Surveyors collected the monthly private pay rates as they ranged from basic care to more substantial care for a one-bedroom unit in an assisted living facility. Where a rate range was provided, the average of the high and low was used in the annual cost calculation.

Annual rates are based on the monthly fee multiplied by 12 months.

Nursing Homes (NH)

Surveyors polled 13 percent of certified and licensed nursing homes, resulting in 3,935 completed surveys.

Surveyors collected the daily rates for private rooms (single occupancy) and semi-private rooms (double occupancy) in Medicare-certified nursing facilities. Medicare-certified nursing homes represent more than 90 percent of all nursing homes in the U.S.[5] The daily room charge usually includes services beyond rent, such as three meals a day, laundry, sundries, basic nurse supervision and generic non-prescription pharmaceuticals.

Annual rates are based on the daily fee multiplied by 365.

[4] Assisted Living Facilities are referred to as Residential Care Facilities in California.

Genworth Cost of Care regions are based on Metropolitan Statistical Areas (MSAs) as defined by the Office of Management and Budget (OMB) (census.gov).

In February 2013, the OMB refined its MSA delineations, thereby impacting some of our region definitions. All 2023 Cost of Care data reflects survey results based on the new delineations.

About Genworth Financial

Genworth Financial, Inc. (NYSE: GNW) is a Fortune 500 company focused on empowering families to navigate the aging journey with confidence, now and in the future. Headquartered in Richmond, Virginia, Genworth provides guidance, products, and services that help people understand their caregiving options and fund their long-term care needs. Genworth is also the parent company of publicly traded Enact Holdings, Inc. (Nasdaq: ACT), a leading U.S. mortgage insurance provider. For more information on Genworth, visit genworth.com, and for more information on Enact Holdings, Inc. visit enactmi.com.

About CareScout

CareScout helps older adults and their families navigate the aging journey and find quality care. Inspired by a mission to simplify and dignify the aging experience, we're building an integrated ecosystem of care and funding solutions. To learn more about CareScout, visit www.CareScout.com. CareScout, LLC (CareScout) is a wholly owned subsidiary of Genworth Financial, Inc. (NYSE: GNW).

Visit genworth.com/costofcare to:

- Compare daily, monthly and annual costs across locations
- Calculate future costs of care

DIRECT CARE WORKERS IN THE UNITED STATES

KEY FACTS
2023

PHI
QUALITY CARE THROUGH QUALITY JOBS

2156

TABLE OF CONTENTS

INTRODUCTION

Direct care workers assist older adults and people with disabilities with essential daily tasks and activities across a range of long-term care settings. This report explores the three primary segments of this workforce:

- **Home Care Workers** are the nearly 2.8 million personal care aides and home health aides (and in some cases, nursing assistants) who support individuals in private homes.
- **Residential Care Aides** are the 718,840 personal care aides, home health aides, and nursing assistants who support individuals in group homes, assisted living communities, and other residential care settings.
- **Nursing Assistants in Nursing Homes** are the 447,940 workers who provide services to individuals living in skilled nursing homes.[1]

The growing population of older adults continues to drive up demand for direct care workers. Over the past decade, the direct care workforce added nearly 1.6 million new jobs, growing from 3.2 million workers in 2012 to 4.8 million in 2022.[2] This trend is projected to continue, with the direct care workforce expected to add just over 1 million new jobs from 2021 to 2031—more new jobs than any other single occupation in the country.[3] When also accounting for jobs that must be filled when existing workers transfer to other occupations or exit the labor force, there will be an estimated 9.3 million total job openings in direct care from 2021 to 2031.[4]

This job growth is occurring primarily in the home and community-based services (HCBS) sector, with the home care workforce projected to increase by 35 percent in the next decade.[5] The number of residential care aides is also projected to increase by 13 percent, although a recent drop in residential care employment makes these growth projections less certain.[6] In contrast, the nursing assistant workforce is expected to continue decreasing in size, with a projected reduction of 3 percent over the next decade.[7] These diverging trends across long-term care industries largely result from consumer preference for home care and public policies that have expanded HCBS funding and access.[8]

In the past 10 years, the direct care workforce has seen incremental wage growth (even after accounting for worsening inflation[9]), largely due to state and federal investments in Medicaid programs and the long-term care workforce. Much of this investment occurred in response to the COVID-19 pandemic.[10] However, this wage growth has slowed dramatically with the reduction of federal pandemic supports. After increasing by $0.68 per hour in 2020, the median hourly wage for direct care workers increased by just $0.07 per hour in 2021 and by $0.02 per hour in 2022, adjusting for inflation.[11] Median wages for home care workers actually declined by $0.72 per hour from 2021 to 2022, as many sources of pandemic-related funding were phased out. These trends mean that direct care wages remain low—the median hourly wage for all direct care workers was just $15.43 in 2022—with home

care workers earning the least. As a result, long-term care employers continue to experience acute recruitment and retention challenges in a persistently competitive labor market.[12]

Low wages combined with a high rate of part-time work make it challenging for direct care workers to financially support themselves and their families. Median annual earnings for direct care workers are just $23,688.[13] Thirty-nine percent of direct care workers live in low-income households (defined as subsisting at less than 200 percent of the federal poverty level), and 46 percent rely on public assistance, such as Medicaid, food and nutrition assistance, or cash assistance.[14] These trends both reflect and perpetuate the racial and gender inequities faced by direct care workers, who are majority women and people of color.[15]

This annual research report begins by describing how the growing, changing population of older adults is impacting demand for direct care, then provides a comprehensive update on three key segments of the direct care workforce: home care workers, residential care aides, and nursing assistants in nursing homes. Each of the workforce sections focuses on demographics, occupational roles, job quality challenges, and projected job openings. Throughout, we highlight the ongoing impact and implications of the COVID-19 pandemic on the long-term care industry and this workforce. Taken together, these analyses underscore the pressing need for job quality interventions across long-term care settings—building on recent investments and progress—to improve the lives of direct care workers and the older adults and people with disabilities they support.

DIRECT CARE WORKER

EMPLOYMENT BY INDUSTRY, 2022

Home Care Workers	58%
Residential Care Aides	15%
Nursing Assistants in Nursing Homes	9%
Direct Care Workers in Other Industries	18%

WAGES BY INDUSTRY, 2012 TO 2022

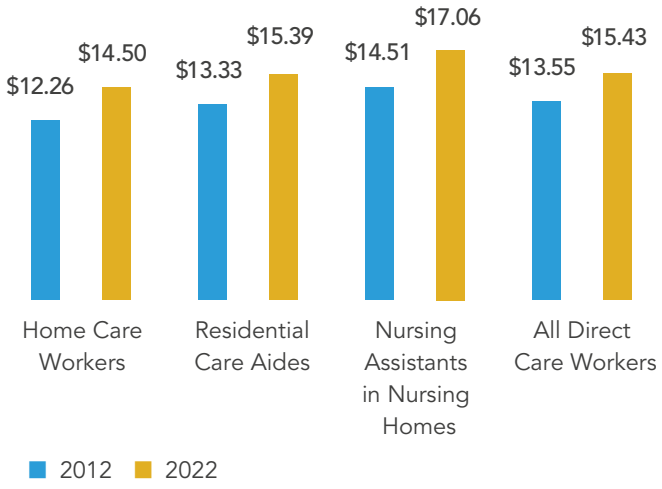

Chart Sources: Other industries employing direct care workers include hospitals and numerous others. U.S. Bureau of Labor Statistics (BLS), Division of Occupational Employment and Wage Statistics (OEWS). 2023. *May 2012 to May 2022 National Occupational Employment and Wage Estimates.* https://www.bls.gov/oes/current/oes_nat.htm; BLS OEWS. 2023. *May 2012 to May 2022 National Industry-Specific Occupational Employment and Wage Estimates.* https://www.bls.gov/oes/current/oessrci.htm; analysis by PHI (June 2023).

U.S. POPULATION PROJECTIONS

From 2020 to 2060, the population of adults age 65 and older in the U.S. is projected to increase dramatically from 56.1 million to 94.7 million.[16] The number of adults age 85 and older is expected to nearly triple over the same period from 6.7 million to 19 million. This demographic shift is the primary driver of job growth in the direct care workforce.

In contrast to the rapid expansion of the older adult population, the population of adults age 18 to 64 is expected to remain relatively stable, which means that there will be fewer potential paid and unpaid caregivers available to support older adults. Currently, the ratio of adults age 18 to 64 to adults age 85 and older is 30 to 1, but that ratio is projected to drop to 12 to 1 by 2060.

PROJECTED POPULATION GROWTH BY AGE GROUP, 2020 TO 2060

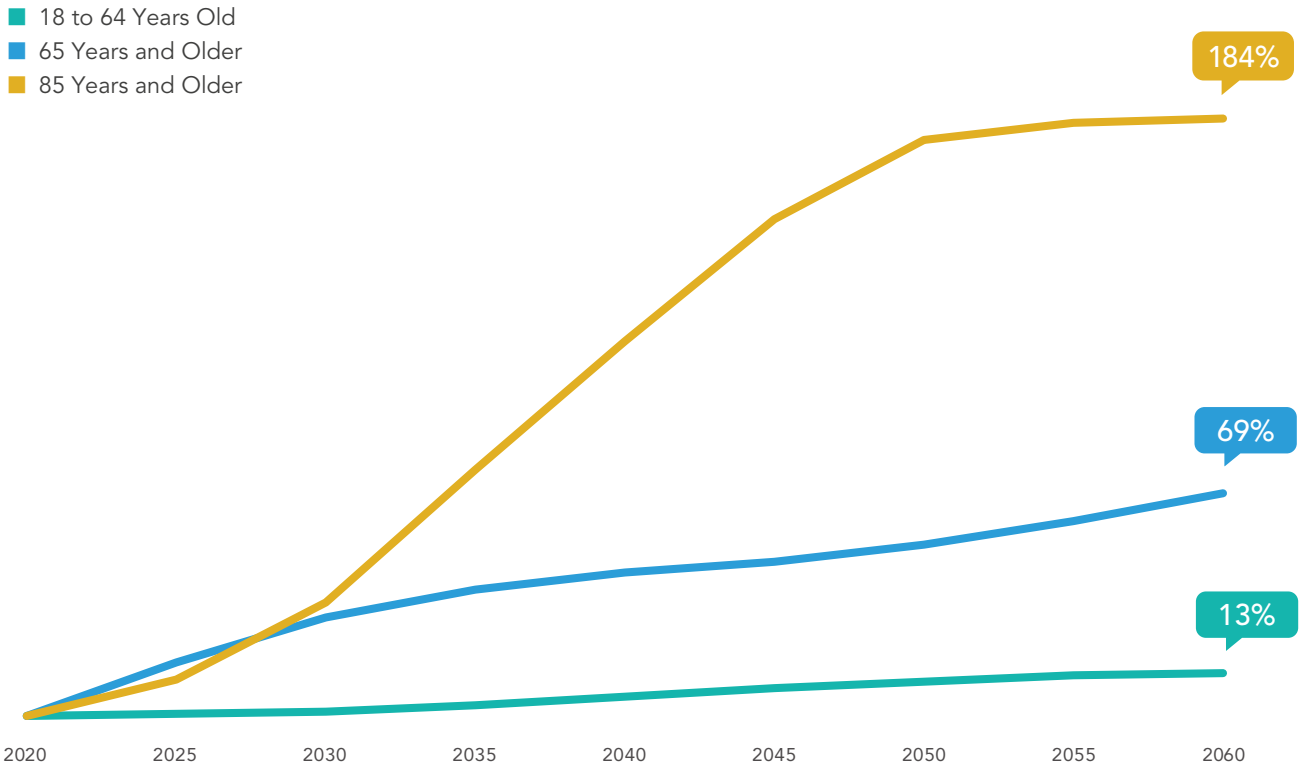

Chart Source: U.S. Census Bureau. 2017. *2017 National Population Projections Datasets, Projected Population by Single Year of Age, Sex, Race, and Hispanic Origin for the United States: 2016 to 2060.* https://www.census.gov/data/tables/2017/demo/popproj/2017-summary-tables.html; analysis by PHI (June 2023).

Growing diversity and acuity among older adults will also shape future demand for direct care workers.[17]

The population of adults age 65 and over will become more diverse by 2060. From 2020 to 2060, the proportion of older adults of color will increase from 24 percent to 45 percent, and the proportion of older adults who are immigrants will increase from 14 percent to 23 percent.

Demographic changes among older adults will likely influence overall long-term care needs and service utilization patterns. These changes also highlight the need to promote cultural and linguistic competency within the direct care workforce, while recognizing workers' own diverse backgrounds, experiences, and barriers.[18]

Individuals are also living longer with complex chronic conditions, such as Alzheimer's disease and other forms of dementia (among other conditions).

About 1 in 9 people age 65 and over are currently living with Alzheimer's disease, the most common form of dementia.[19] As our population grows older, the number of older adults with Alzheimer's disease is expected to more than double, from 6.7 million in 2023 to 13.8 million in 2060.[20] This trend will drive up demand for direct care workers since more than a third of individuals across all long-term care settings are living with Alzheimer's disease or another form of dementia.[21]

OLDER ADULT POPULATION BY RACE / ETHNICITY AND NATIVITY, 2020 AND 2060

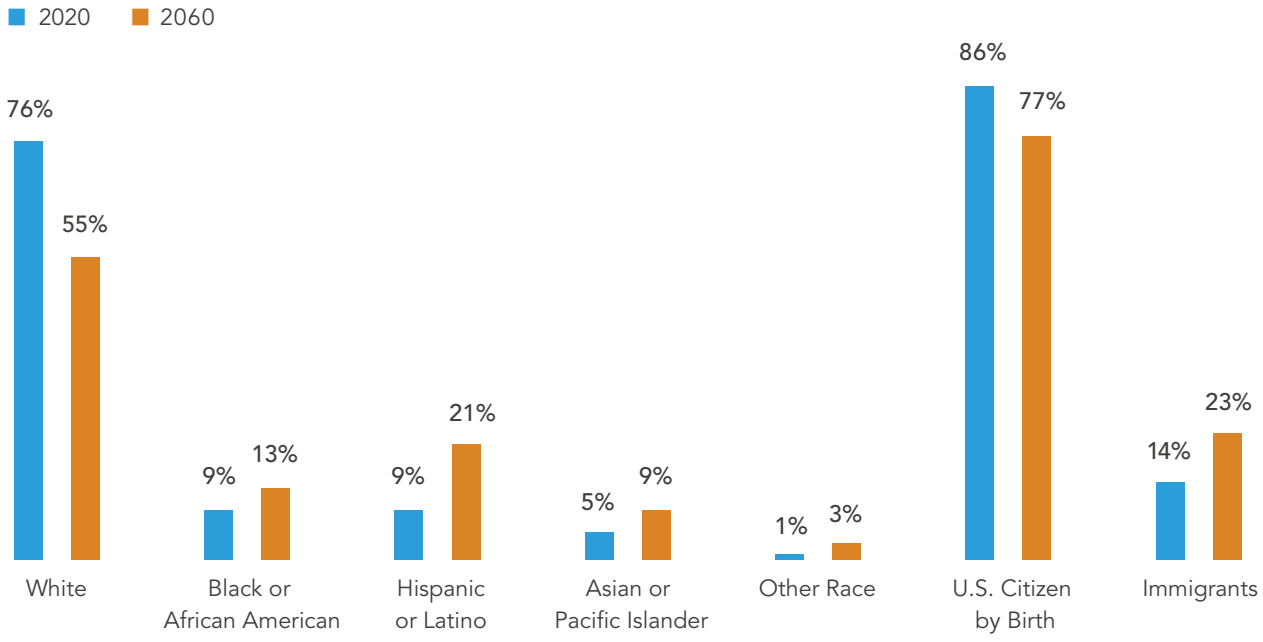

Chart Sources: The percentages shown in the chart do not total 100 percent because they are rounded to the nearest whole percentage. U.S. Census Bureau. 2017. 2017 *National Population Projections Datasets, Projected Population by Single Year of Age, Sex, Race, and Hispanic Origin for the United States: 2016 to 2060.* https://census.gov/data/tables/2017/demo/popproj/2017-summary-tables.html; U.S. Census Bureau. 2017. *2017 National Population Projections Datasets, Projected Population by Single Year of Age, Sex, Race, Hispanic Origin and Nativity for the United States: 2016 to 2060.* https://census.gov/data/tables/2017/demo/popproj/2017-summary-tables.html; analysis by PHI (July 2023).

HOME CARE WORKERS

Home care workers (primarily personal care aides and home health aides, as well as some nursing assistants) assist more than 9.8 million older adults and people with disabilities living at home.[22] The home care workforce is one of the largest and fastest growing occupations in the U.S. due to a combination of factors, including the rapidly expanding population of older adults, consumer preferences for aging and receiving care in place, and the increasing provision of home and community-based services (HCBS).[23] After incrementally increasing in recent years, home care worker wages dropped substantially from 2021 to 2022 when adjusted for inflation, and a large number of workers live in low-income households. In the context of persistently high turnover and a historically tight labor market, home care employers are struggling more than ever to recruit and retain enough workers to meet escalating demand.[24]

WHO ARE HOME CARE WORKERS?

Home care workers are primarily women, people of color, and immigrants, and therefore face heightened risks of discrimination throughout their lives in areas including housing, education, employment, health care, and more.[25] Gender, racial, and other forms of equity are central concerns for this workforce.[26]

- **Eighty-five percent of home care workers are women.**[27]
- **Home care workers have a median age of 48.** Thirty-five percent of the home care workforce is age 55 and over, compared to 23 percent of the U.S. labor force overall.[28]
- **While people of color make up 40 percent of the total U.S. labor force,[29] they constitute 66 percent of all home care workers.** Twenty-six percent of home care workers are Black or African American and 26 percent are Hispanic or Latino (any race).

American Community Survey, 2021.* https://doi.org/10.18128/D010.V13.0; analysis by PHI (June 2023). Flood, Sarah M., Liana C. Sayer, and Daniel Backman. *American Time Use Survey Data Extract Builder: Version 3.1. American Time Use Survey, 2011-2021.* https://doi.org/10.18128/D060.V3.1; analysis by PHI (June 2023). This estimate draws on ten years of pooled data from the American Time Use Survey.

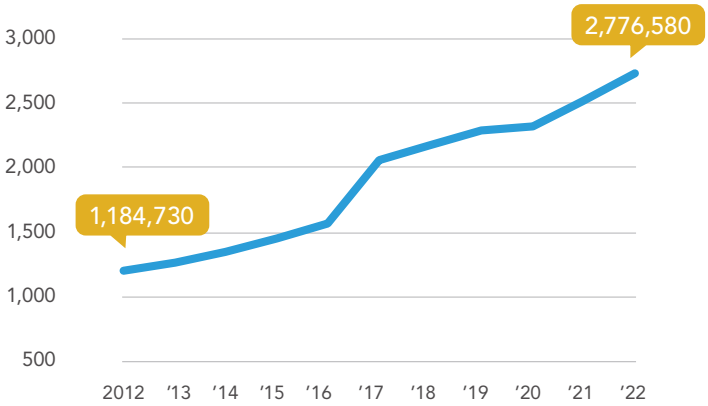
THE ROLE OF HOME CARE WORKERS

Home care workers assist older adults and people with disabilities living at home with activities of daily living (ADLs), which include eating, dressing, toileting, mobility, and bathing.[32] Other responsibilities differ across occupational groups within the home care sector. **Personal care aides** also provide other household assistance and/or social support to help individuals remain engaged in their communities. **Home health aides** (and in some cases, **nursing assistants**[33]) also perform certain clinical tasks under the remote or intermittent onsite supervision of a licensed professional. Although formally classified as personal care aides in most cases, **direct support professionals** constitute a distinct occupational group within this workforce that provides habilitation services, employment assistance, and other supports to people with intellectual and developmental disabilities.[34] *(See Occupational Titles and Industry Classifications on page 28 for more details.)*

- **The home care workforce more than doubled in size over the past 10 years, from nearly 1.2 million in 2012 to nearly 2.8 million in 2022.**
- PHI estimates that **at least 1.2 million home care workers are employed as "independent providers" through Medicaid-funded consumer-direction programs,** based on 2019 survey data on consumer enrollment in these programs.[35]

  It is very difficult to accurately estimate the number of independent providers, however. Due to a 2017 methodological change, a proportion of these workers hired through consumer-direction programs are now captured by the Bureau of Labor Statistics (BLS) Occupational Employment and Wage Statistics (OEWS) program.[36] However, the accuracy of these data varies by state and many independent providers are likely excluded. More broadly, the OEWS data do not include self-employed home care workers who are hired directly and paid out-of-pocket by consumers through the "gray market."[37]
- **Home care workers constitute 58 percent of the total direct care workforce,** which also includes workers who are employed in residential care, nursing homes, and other settings.

HOME CARE WORKER EMPLOYMENT, 2012 TO 2022



DIRECT CARE WORKER EMPLOYMENT BY INDUSTRY, 2022

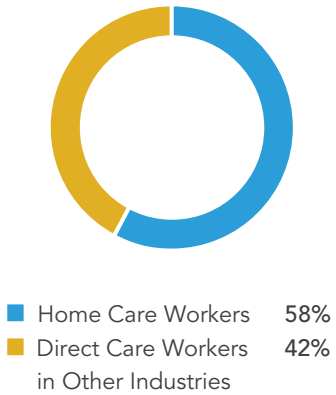


Chart Sources: U.S. Bureau of Labor Statistics (BLS), Division of Occupational Employment and Wage Statistics (OEWS). 2023. May 2012 to May 2022 *National Occupational Employment and Wage Estimates*. https://www.bls.gov/oes/current/oes_nat.htm; BLS OEWS. 2023. *May 2012 to May 2022 National Industry-Specific Occupational Employment and Wage Estimates*. https://www.bls.gov/oes/current/oessrci.htm; analysis by PHI (June 2023).

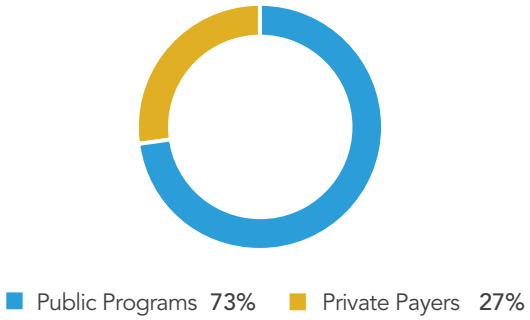
- Home care jobs are predominantly government funded. **Payments from public programs (primarily Medicaid and Medicare) constitute 73 percent of the home care industry's $123.4 billion in total annual revenue.**[38]

Chart Source: U.S. Census Bureau. 2021. *Economic Census of the United States, Health Care and Social Assistance: Sales, Value of Shipments, or Revenue by Type of Payer for the U.S. and States: 2017.* https://data.census.gov/cedsci/table?q=EC1762TYPEPAYER&n=6216%3A6231%3A6232%3A6233&tid=ECNTYPEPAYER2017.EC1762TYPEPAYER; analysis by PHI (June 2022).

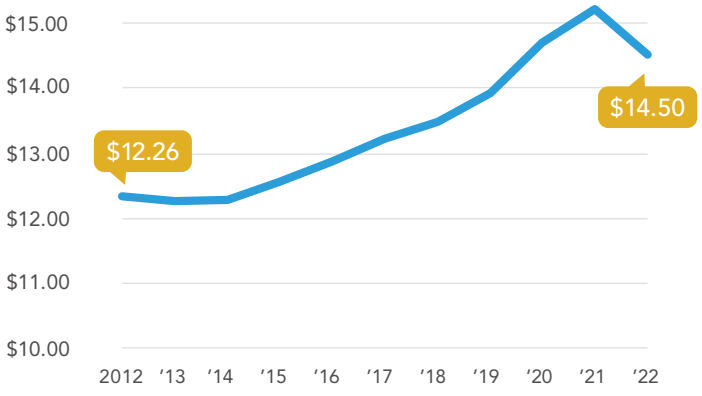
HOME CARE INDUSTRY REVENUE BY SOURCE, 2017



CHALLENGES FOR HOME CARE WORKERS

- **Home care workers' wages have risen somewhat over the past 10 years:** inflation-adjusted median hourly wages rose from $12.26 in 2012 to $14.50 in 2022. Recent wage growth was largely driven by COVID-19 pandemic-related funding measures, **but this growth trend is slowing and may even be reversing** as these funding measures wind down: inflation-adjusted median hourly wages for home care workers declined from $15.22 in 2021 to $14.50 in 2022.

HOME CARE WORKER MEDIAN HOURLY WAGES, ADJUSTED FOR INFLATION, 2012 TO 2022



- **In addition to experiencing a decrease in median hourly wages, more home care workers are working part-time hours. Forty-three percent of home care workers work part time,** defined as fewer than 35 hours per week.[39] Thirty-six percent work part time for "non-economic reasons," which include personal or family obligations and health issues, among other reasons. Seven percent work part time for "economic reasons," which means they cannot find full-time work due to economic conditions at their workplaces or in the broader labor market.

HOME CARE WORKERS BY EMPLOYMENT STATUS, 2022

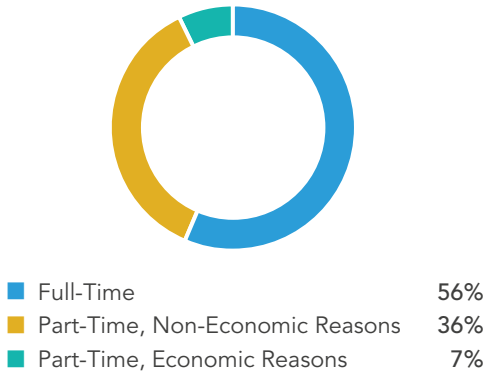


Chart Source: U.S. Bureau of Labor Statistics (BLS), Division of Occupational Employment Statistics (OEWS). 2023. *May 2012 to May 2022 National Industry-Specific Occupational Employment and Wage Estimates.* https://www.bls.gov/oes/current/oessrci.htm; analysis by PHI (June 2023).
The percentages shown in the employment status chart do not total 100 percent because they are rounded to the nearest whole percentage. Flood, Sarah M., Miriam King, Renae Rodgers, Steven Ruggles, J. Robert Warren, and Michael Westberry. 2023. *IPUMS USA: Version 9.0. Current Population Survey, 2022.* https://doi.org/10.18128/D030.V10.0; analysis by PHI (June 2023).

- **Sixteen percent of home care workers typically work more than 40 hours per week.**[40]
- Because of low wages and part-time hours, **home care workers earn a median annual income of $20,599.**[41]
- Low incomes lead to high poverty rates among home care workers: **15 percent live in a household below the federal poverty level and 42 percent live in low-income households.**[42]
- Because of high poverty rates, **more than half of home care workers receive some form of public assistance.**
- **Thirty-seven percent of home care workers are housing cost-burdened,** meaning that their housing costs—including rent or mortgage payments—exceed 30 percent of their household income.
- **Fifteen percent of home care workers lack health insurance,** while 43 percent rely on public coverage, most commonly Medicaid.

HOME CARE WORKERS

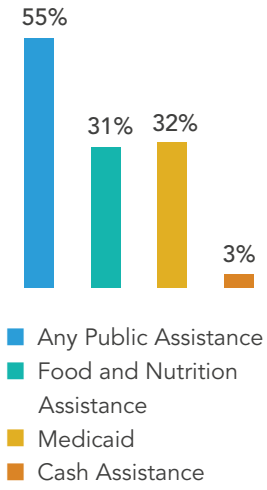
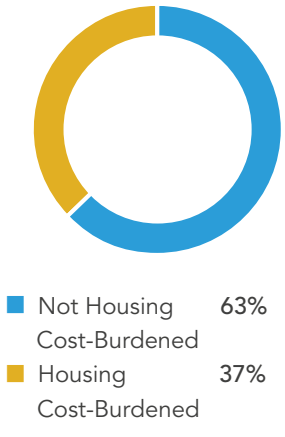
ACCESSING PUBLIC ASSISTANCE, 2021



HOUSING COST-BURDENED, 2021



BY HEALTH INSURANCE STATUS, 2021

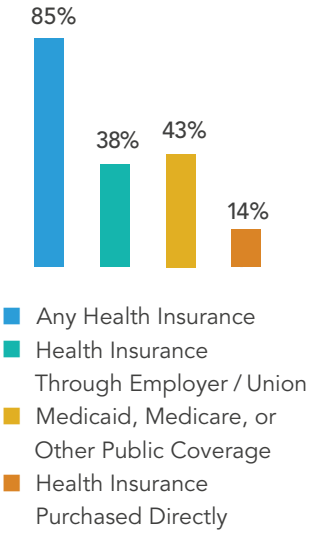


Chart Source: Ruggles, Steven, Sarah Flood, Matthew Sobek, Danika Brockman, Grace Cooper, Stephanie Richards, and Megan Schouweiler. 2023. *IPUMS USA: Version 13.0. American Community Survey, 2021*. https://doi.org/10.18128/D010.V13.0; analysis by PHI (June 2023). Ruggles, Steven, Sarah Flood, Matthew Sobek, Danika Brockman, Grace Cooper, Stephanie Richards, and Megan Schouweiler. 2023. *IPUMS USA: Version 13.0. American Community Survey, 2021*. https://doi.org/10.18128/D010.V13.0; analysis by PHI (June 2023). The percentages for specific forms of coverage in the health insurance chart do not total 85 percent because workers may have more than one source of coverage.

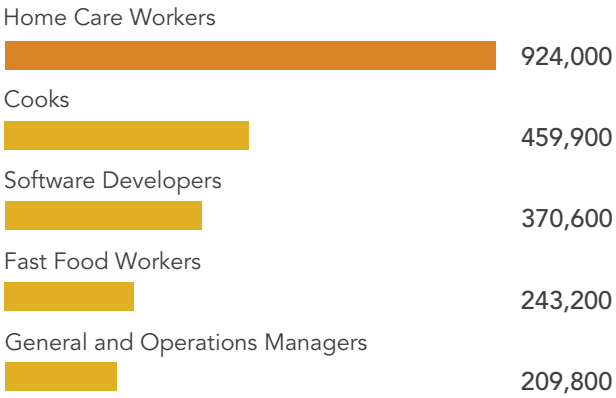
FUTURE DEMAND FOR HOME CARE WORKERS

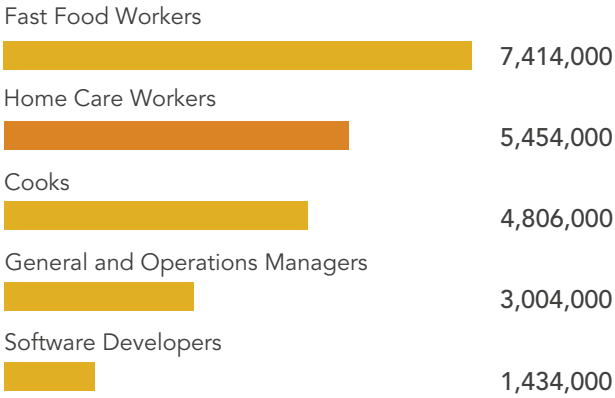
- **The home care workforce is projected to add over 900,000 new jobs from 2021 to 2031—more new jobs than any other occupation in the U.S.** The occupation with the second-largest projected growth, which is cooks, will add nearly 500,000 fewer jobs than the home care workforce.

- **From 2021 to 2031, the home care workforce will have nearly 5.5 million total job openings.** This figure includes 924,000 new jobs created by growth in demand, 2.3 million job openings caused by workers moving into other occupations, and 2.3 million job openings due to workers leaving the labor force altogether.[43] The home care workforce ranks second among all U.S. occupations for total projected job openings.

OCCUPATIONS WITH MOST JOB GROWTH, 2021 TO 2031



OCCUPATIONS WITH THE MOST TOTAL JOB OPENINGS, 2021 TO 2031



CONCLUSION

While minimum wage increases, Medicaid policy changes, and COVID-19-related funding helped boost wages for home care workers in recent years, this wage growth reversed in 2022—and a growing number of home care workers work part-time hours. Low wages and part-time hours mean that a large proportion of home care workers are still living in low-income households and relying on public assistance to make ends meet. In turn, inadequate compensation and other job quality concerns continue to drive high turnover and cause widespread job vacancies.[44] The ongoing impacts of the COVID-19 pandemic have slowed some of the projected growth in new home care jobs as compared to previous years' employment projections; however, this workforce is still expected to add more new jobs than any other occupation in the years ahead. At the same time, *total* projected job openings in home care have increased significantly compared to earlier estimates, reflecting the persistent job quality and retention challenges in the sector.

Chart Sources: U.S. Bureau of Labor Statistics (BLS), Employment Projections Program (EPP). 2022. *National Employment Matrix - Industry*. https://data.bls.gov/projections/nationalMatrixHome?ioType=i; BLS EPP. 2022. *EP Data Tables, Table 1.10 Occupational Separations and Openings, Projected 2021–2031*. https://www.bls.gov/emp/tables.htm; analysis by PHI (June 2023).

RESIDENTIAL CARE AIDES

Residential care aides support more than 1.2 million individuals living in residential care settings in the U.S., which range from small group homes to assisted living and life plan communities (i.e., senior living communities with tiered levels of care).[45] The number of residential care aides dropped somewhat in 2021, then recovered in 2022, but projected employment growth has slowed overall.[46] Despite these fluctuations, residential care aides play a prominent role in the nation's long-term care system but—like other direct care workers—continue to work in poor-quality jobs.

WHO ARE RESIDENTIAL CARE AIDES?

Residential care aides are majority women and people of color, and disproportionately immigrants, and therefore face heightened risks of discrimination throughout their lives in areas including housing, education, employment, health care, and more.[47] Gender, racial, and other forms of equity are central concerns for this workforce.[48]

- **Eighty-five percent of residential care aides are women.**[49]
- **Residential care aides have a median age of 40.** Twenty percent of residential care aides are age 16 to 24, compared to 13 percent of the total U.S. labor force.[50]
- **While people of color make up 40 percent of the total U.S. labor force,**[51] **they constitute 60 percent of residential care aides.** Thirty-three percent of residential care aides are Black or African American.

THE ROLE OF RESIDENTIAL CARE AIDES

Residential care aides assist individuals with daily tasks and activities in community-based residential care settings. These roles are filled by **personal care aides, home health aides,** and **nursing assistants,** depending on state-level regulations and employers' hiring practices. Although formally classified as personal care aides in most cases, **direct support professionals** specifically support residents with intellectual and developmental disabilities in residential care settings. *(See Occupational Titles and Industry Classifications on page 28 for more details.)*

- **The residential care aide workforce added 153,980 jobs in total over the past 10 years, increasing in size from 564,860 workers in 2012 to 718,840 in 2022.**[54] After losing over 27,000 jobs from 2020 to 2021, the residential care aide workforce gained back over 71,000 jobs in 2022.

- **Residential care aides constitute 15 percent of the total direct care workforce,** which also includes workers who are employed in home care, nursing homes, and other settings.

- Of the residential care industry's $136 billion in total annual revenue, **40 percent comes from public programs**, primarily Medicaid and Medicare, and **36 percent comes from private sources**, including long-term care insurance and out-of-pocket payments.[55]

Revenue sources vary across residential care. Public sources constitute 66 percent of revenue in residential care homes for people with intellectual and developmental disabilities, versus 16 percent of revenue in assisted living and continuing care retirement communities.[56]

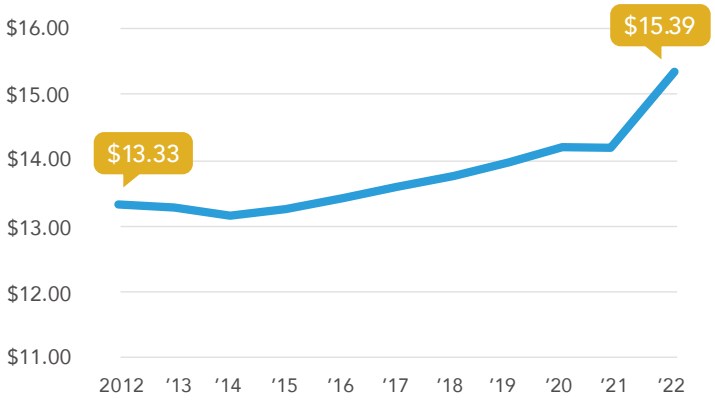
U.S. Census Bureau. 2022. *Service Annual Survey, Estimated Sources of Revenue for Employer Firms: 2013 through 2021.* https://www.census.gov/data/tables/2021/econ/services/sas-naics.html (July 2023). Other sources of revenue include other healthcare providers; contributions, gifts, and grants; investment and property income; property, auto, and casualty insurances; and all other non-classifiable sources of revenue.

CHALLENGES FOR RESIDENTIAL CARE AIDES

- **Residential care aides' wages have risen somewhat over the past 10 years:** inflation-adjusted median hourly wages were $13.33 in 2012 and $15.39 in 2022. This trend means that residential care aides' wages have increased slightly faster than the costs of goods and services over the past decade.
- **More than one in four residential care aides work part time,** defined as fewer than 35 hours per week. The proportion of residential care aides working part time has increased from about one in five in the previous year. Twenty-four percent work part time for "non-economic reasons," which include personal or family obligations and health issues, among other reasons. Four percent work part time for "economic reasons," which means they cannot find full-time work due to economic conditions at their workplaces or in the broader labor market.
- **Fifteen percent of residential care aides typically work more than 40 hours per week.**

RESIDENTIAL CARE AIDE(S)

MEDIAN HOURLY WAGES, ADJUSTED FOR INFLATION, 2012 TO 2022

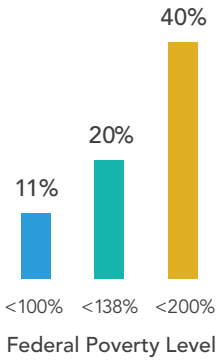


BY EMPLOYMENT STATUS, 2022

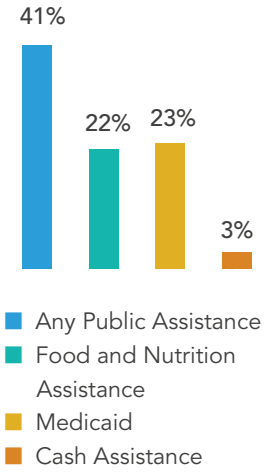
The percentages shown in the employment status chart do not total 100 percent because they are rounded to the nearest whole percentage.

RESIDENTIAL CARE AIDES

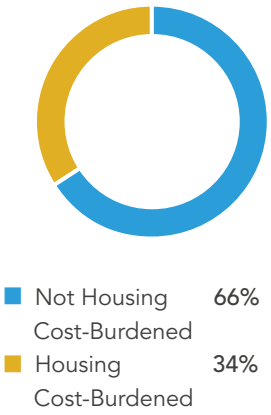
BY POVERTY LEVEL, 2021



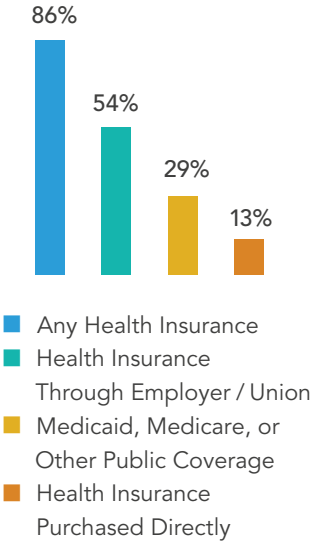
ACCESSING PUBLIC ASSISTANCE, 2021



HOUSING COST-BURDENED, 2021



BY HEALTH INSURANCE STATUS, 2021



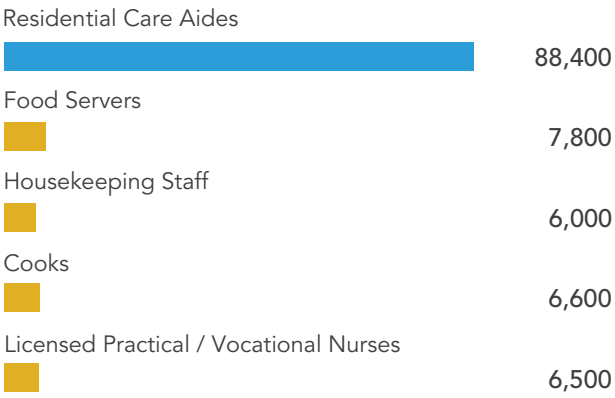
- Because of low wages and a prevalence of part-time hours, **residential care aides earn a median annual income of $24,718.**
- Low incomes lead to high poverty rates among residential care aides: **11 percent live in a household below the federal poverty level and 40 percent live in low-income households.**
- Because of high poverty rates among residential care aides, **41 percent receive some form of public assistance.**
- **Thirty-four percent of residential care aides are housing cost-burdened, meaning that their housing costs**—including rent or mortgage payments—exceed 30 percent of their household income.
- **Fourteen percent of residential care aides lack health insurance.** Fifty-four percent receive insurance through an employer or union (including insurance through their spouses), while 29 percent rely on public coverage, most commonly Medicaid.

Chart Source: Ruggles, Steven, Sarah Flood, Matthew Sobek, Danika Brockman, Grace Cooper, Stephanie Richards, and Megan Schouweiler. 2023. *IPUMS USA: Version 13.0. American Community Survey, 2021.* https://doi.org/10.18128/D010.V13.0; analysis by PHI (June 2023). The percentages for specific forms of coverage in the health insurance chart do not total 86 percent because workers may have more than one source of coverage.

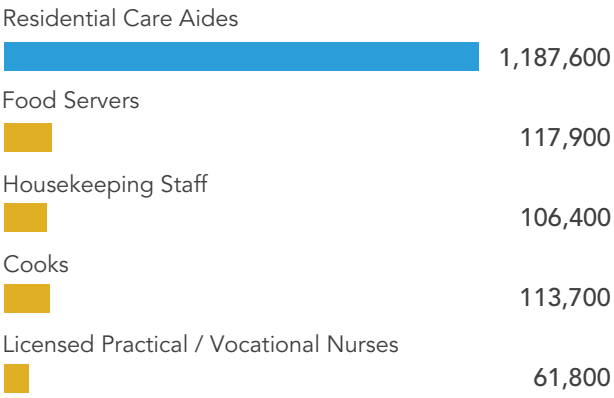
FUTURE DEMAND FOR RESIDENTIAL CARE AIDES

- **The residential care aide workforce, which is the largest occupational group within residential care settings by far, is projected to add 88,400 new jobs from 2021 to 2031.**
- **From 2021 to 2031, the residential care aide workforce will have nearly 1.2 million total job openings.** This figure includes 88,400 new jobs created by growth in demand plus 538,100 job openings caused by workers moving into other occupations and 561,100 job openings due to workers leaving the labor force altogether.[62] Projected job openings in residential care aide roles are nearly three times the sum of all projected job openings for the next top four occupations in residential care settings.

JOB GROWTH IN RESIDENTIAL CARE BY OCCUPATION, 2021 TO 2031



JOB OPENINGS IN RESIDENTIAL CARE BY OCCUPATION, 2021 TO 2031



CONCLUSION

As in home care, recruitment and retention in the residential care sector have been acutely challenging in recent years due to rising demand coupled with poor job quality for residential care aides. While the total number of residential care aide jobs recovered in 2022 after a temporary decline, job quality and retention issues persist; notably, residential care aide median hourly wages and median annual incomes have only increased slightly, while the number of residential care aides working part-time hours has increased. As a result of these challenges, total projected job openings for residential care aides have increased from previous estimates, due in part to a higher expected rate of transfers out of this occupation. Considering the prominent role of private payers and providers in determining compensation and other aspects of job quality for residential care aides, transforming these jobs continues to require significant investments through private as well as public channels.

NURSING ASSISTANTS IN NURSING HOMES

Nursing assistants provide 24-hour care and personal assistance to 1.2 million nursing home residents across the U.S.[63] While demand for nursing home care has declined in recent years, nursing homes continue to play a critical role in supporting individuals with complex needs. Low wages, heavy workloads, and long work hours—driven by chronic understaffing and greatly exacerbated by the ongoing COVID-19 pandemic—contribute to high rates of stress, injury, and burnout among nursing assistants in nursing homes.[64] For these reasons, the median turnover rate among nursing assistants in nursing homes is nearly 100 percent,[65] and employers struggle to fill vacant positions. To ensure quality care for nursing home residents, interventions aimed at improving job quality are needed to strengthen the nursing assistant workforce.

WHO ARE NURSING ASSISTANTS IN NURSING HOMES?

Nursing assistants are primarily women, people of color, and immigrants, and therefore face heightened risks of experiencing discrimination throughout their lives in areas including housing, education, employment, health care, and more.[66] Gender, racial, and other forms of equity are central concerns for this workforce.[67]

- **More than 90 percent of nursing assistants are women.**[68]
- **Nursing assistants have a median age of 38.** Twenty-one percent of nursing assistants are age 16 to 24, compared to 13 percent of the total U.S. labor force.
- **While people of color make up 40 percent of the total U.S. labor force,**[69] **they constitute 56 percent of all nursing assistants in nursing homes.** Thirty-five percent of nursing assistants are Black or African American.

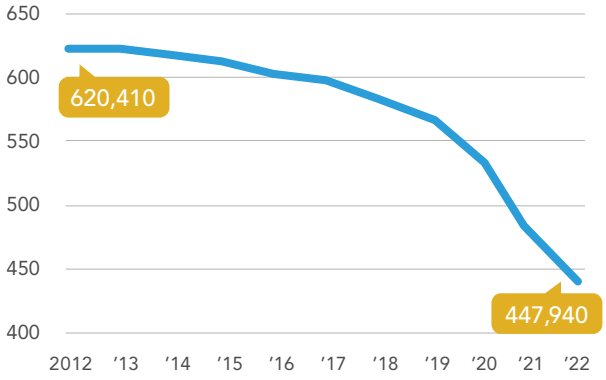
Sayer, and Daniel Backman. *American Time Use Survey Data Extract Builder: Version 3.1. American Time Use Survey, 2011-2021*. https://doi.org/10.18128/D060.V3.1; analysis by PHI (June 2023). This estimate draws on a decade of pooled data from the American Time Use Survey.

THE ROLE OF NURSING ASSISTANTS IN NURSING HOMES

Nursing assistants support nursing home residents with daily tasks such as dressing, bathing, eating, and mobility. They also help residents participate in various social activities and events such as classes, performances, and religious services. Further, nursing assistants perform certain clinical tasks under the supervision of onsite licensed professionals. *(See Occupational Titles and Industry Classifications on page 28 for more details.)*

- **The number of nursing assistants in nursing homes has steadily declined over the past decade, from 620,410 in 2012 to 447,940 in 2022.** From 2021 to 2022 alone, the nursing assistant workforce lost 23,220 jobs. Five-year data indicate that the number of nursing home residents has also decreased by 10 percent from 2017 to 2022.[72]
- **Nursing assistants in nursing homes constitute nine percent of the total direct care workforce,** which also includes workers employed in home care, residential care, and other settings.
- **Among all nursing staff, nursing assistants spend the most time with residents, providing 62 percent of all nursing hours, at a median of two hours of direct care per resident per day.** Because of their frequent interactions with residents, nursing assistants are well-positioned to observe changes in resident condition and report these changes to licensed nursing staff.

NURSING ASSISTANT EMPLOYMENT IN NURSING HOMES, 2012 TO 2022



DIRECT CARE WORKER EMPLOYMENT BY INDUSTRY, 2022

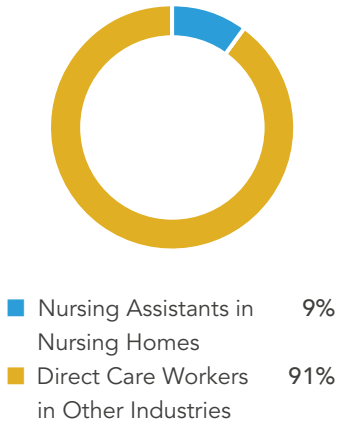


Chart Sources: U.S. Bureau of Labor Statistics (BLS), Division of Occupational Employment and Wage Statistics (OEWS). 2023. *May 2012 to May 2022 National Occupational Employment and Wage Estimates.* https://www.bls.gov/oes/current/oes_nat.htm; BLS OEWS. 2023. *May 2012 to May 2022 National Industry-Specific Occupational Employment and Wage Estimates.* https://www.bls.gov/oes/current/oessrci.htm; analysis by PHI (June 2023).

- **On average, nursing assistants support 12 residents during each shift,** while 10 percent of nursing assistants typically assist 18 or more residents.[73]
- **More than half of all nursing homes (56 percent) relied on nursing assistants from staffing agencies to fill staffing vacancies in 2022.** This figure indicates a continued reliance on contract staffing, which increased from 41 percent of all nursing homes in 2020 and peaked in 2021 at 62 percent.
- **Over one-third (34 percent) of nursing homes employ medication aides** who are nursing assistants that are trained and authorized to administer medications under the supervision of a licensed professional.[74]
- Nursing assistant jobs are predominantly government funded. Of the nursing home industry's $128 billion in total annual revenue, **payments from public programs (primarily Medicaid and Medicare) constitute 66 percent.**[75]

MEDIAN STAFF HOURS PER RESIDENT PER DAY BY OCCUPATION, 2022

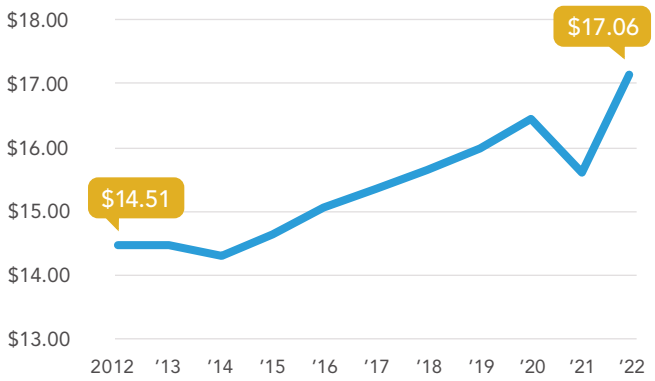
Other sources of revenue include other healthcare providers; contributions, gifts, and grants; investment and property income; property, auto, and casualty insurances; and all other non-classifiable sources of revenue.

CHALLENGES FOR NURSING ASSISTANTS IN NURSING HOMES

- **Nursing assistants' wages have risen slightly over the past 10 years, although with some variation:** inflation-adjusted median hourly wages increased from $14.51 in 2012 to $17.06 by 2022, but with notable wage decreases during that period as well. This overall trend means that nursing assistants' wages have only increased slightly faster than the costs of goods and services over the past decade.
- **More than one in four nursing assistants works part time,** defined as fewer than 35 hours per week.[76] That figure is up from 21 percent in the previous year.[77] Twenty-five percent work part time for "non-economic reasons," which include personal or family obligations and health issues, among other reasons. Three percent work part time for "economic reasons," which means they cannot find full-time work due to economic conditions at their workplaces or in the broader labor market.
- **Twelve percent of nursing assistants typically work more than 40 hours per week.**[78]
- Due to low wages and a prevalence of part-time hours, **nursing assistants earn a median annual income of $25,748.**[79]

NURSING ASSISTANT(S)

MEDIAN HOURLY WAGES, ADJUSTED FOR INFLATION, 2012 TO 2022



BY EMPLOYMENT STATUS, 2022

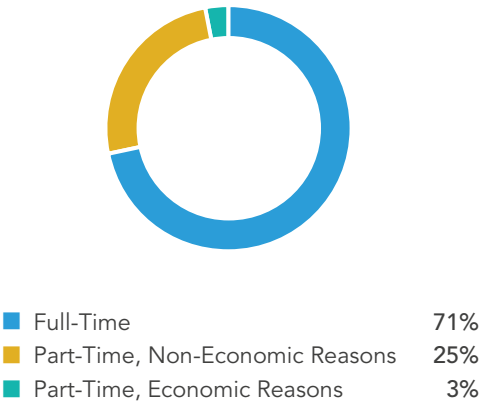


Chart Source: U.S. Bureau of Labor Statistics (BLS), Division of Occupational Employment Statistics (OEWS). 2023. *May 2012 to May 2022 National Industry-Specific Occupational Employment and Wage Estimates.* https://www.bls.gov/oes/current/oessrci.htm; analysis by PHI (June 2023). Flood, Sarah M., Miriam King, Renae Rodgers, Steven Ruggles, J. Robert Warren, and Michael Westberry. 2023. *Integrated Public Use Microdata Series, Current Population Survey, 2022: Version 9.0.* https://doi.org/10.18128/D030.V10.0; analysis by PHI (June 2023). The percentages shown in the employment status chart do not total 100 percent because they are rounded to the nearest whole percentage.

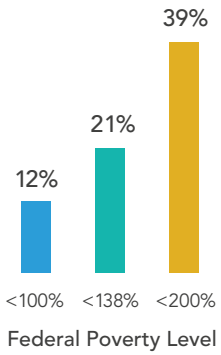
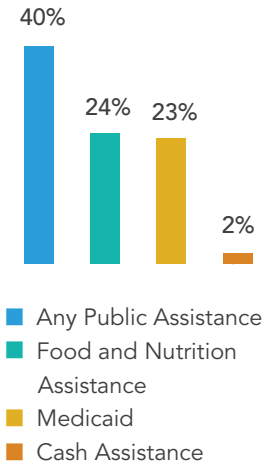
- Low incomes lead to high poverty rates among nursing assistants: **12 percent live in a household below the federal poverty level and 39 percent live in low-income households.**[80]
- Because poverty rates are high among nursing assistants, **40 percent rely on some form of public assistance.**
- **Thirty-two percent of nursing assistants are housing cost-burdened,** meaning that their housing costs—including rent or mortgage payments—exceed 30 percent of their household income.
- **Thirteen percent of nursing assistants in nursing homes lack health insurance.** Fifty-eight percent of nursing assistants have insurance through an employer or union (including insurance through their spouses), while 28 percent rely on public coverage, most commonly Medicaid.

NURSING ASSISTANTS

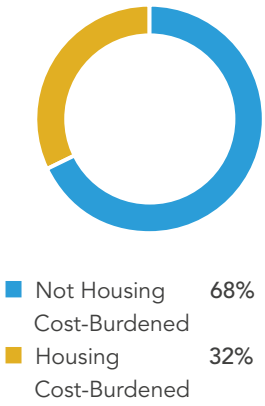
BY POVERTY LEVEL, 2021



ACCESSING PUBLIC ASSISTANCE, 2021



HOUSING COST-BURDENED, 2021



BY HEALTH INSURANCE STATUS, 2021

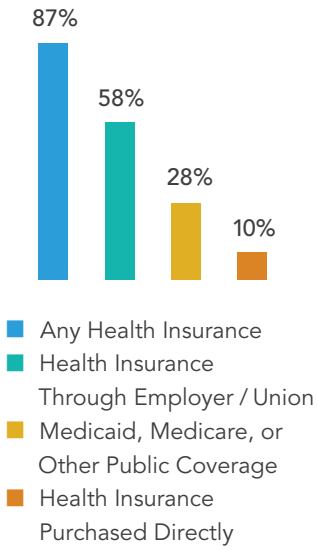


Chart Source: Ruggles, Steven, Sarah Flood, Matthew Sobek, Danika Brockman, Grace Cooper, Stephanie Richards, and Megan Schouweiler. 2023. *IPUMS USA: Version 13.0. American Community Survey, 2021*. https://doi.org/10.18128/D010.V13.0; analysis by PHI (June 2023). The percentages for specific forms of coverage in the health insurance chart do not total 87 percent because workers may have more than one source of coverage.

- **Nursing assistants are nearly eight times more likely to experience workplace injuries than the typical U.S. worker.** Because work-related illness is considered a "workplace injury," COVID-19 caused injury rates among nursing assistants to increase by more than 300 percent from 2019 (299 injuries per 10,000 workers) to 2020 (1,014 injuries per 10,000 workers), the most recent year of occupation-specific data available. Industry-level (but not occupation-specific) data do show a decrease in nursing home worker injuries and illnesses from 2020 to 2021, but overall injury and illness incidence rates in nursing homes remain some of the highest in any industry.

ANNUAL INJURY RATES PER 10,000 WORKERS BY CAUSE OF INJURY, 2020

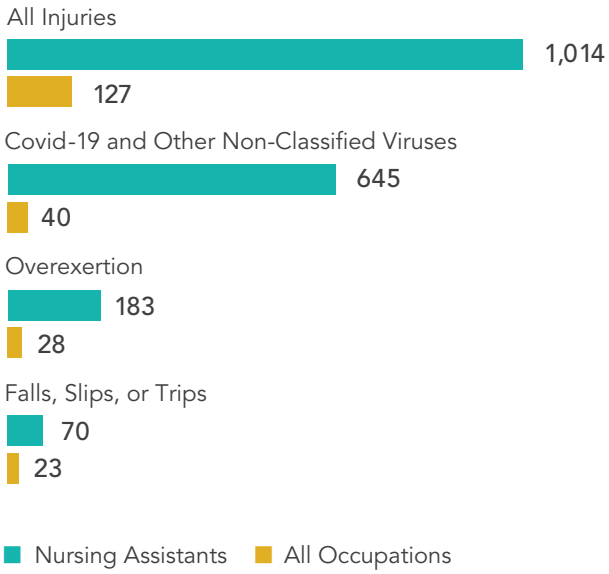

Chart Source: Work absences due to COVID-19 are included in a category of workplace injury called "Other diseases due to viruses, not elsewhere classified," according to the Occupational Injury and Illness Classification System, Version 2.01. A corresponding analysis of workplace injuries among home care workers and residential care aides has not been conducted for this report due to data limitations. U.S. Bureau of Labor Statistics (BLS), Injuries, Illnesses, and Fatalities (IIF). 2021. Occupational Injuries and Illnesses and Fatal Injuries Profiles. https://www.bls.gov/iif/; BLS IIF. 2021. Nonfatal Illnesses Due to Novel Viruses by Occupation. https://www.bls.gov/iif/how-covid-19-is-reflected-in-the-soii-data.htm; analysis by PHI (June 2022).

THE IMPACT OF COVID-19 ON NURSING HOMES

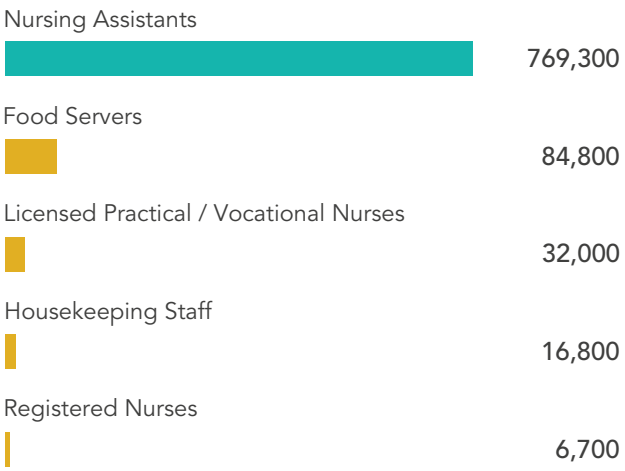
The COVID-19 pandemic devastated the nursing home sector, and the crisis is not over. While more nursing home staff (including nursing assistants) received vaccine booster doses in 2023 as compared to previous years, many staff and residents remain vulnerable to COVID-19, with deaths attributed to the disease continuing to climb.

From January 2020 to July 2023, 164,165 nursing home residents and 3,061 staff died from COVID-19. In the past year alone—from July 2022 through July 2023—over 11,000 resident deaths and nearly 700 staff deaths were attributed to COVID-19. Broad-based efforts are still needed to address the long-standing challenges in nursing homes that continue to amplify the negative consequences of the COVID-19 pandemic for this sector—and to help address the trauma experienced in recent years by those who live and work in nursing homes.

FUTURE DEMAND FOR NURSING ASSISTANTS IN NURSING HOMES

- **From 2021 to 2031, the nursing assistant workforce is projected to lose 17,200 jobs** due to decreasing demand for nursing home care overall.[85]
- **However, the projected number of total job openings for nursing assistants in nursing homes continues to increase. From 2021 to 2031, this workforce will have 769,300 total job openings.** This figure includes 442,400 job openings caused by workers moving into other occupations and 344,100 job openings due to workers exiting the labor force altogether.[86] Job openings for nursing assistants in nursing homes during this time period are projected to be over five times higher than job openings in the next four nursing home occupations combined.

JOB OPENINGS IN NURSING HOMES BY OCCUPATION, 2021 TO 2031



CONCLUSION

Although overall demand for nursing homes is declining, there is still a pressing need to recruit and retain enough nursing assistants to support individuals with complex needs in this care setting. The pandemic has both revealed and greatly exacerbated workforce challenges in nursing homes, as indicated, for example, by the increasing reliance on contract nursing assistants.[87] In response to these ongoing challenges, several states have taken steps to improve job quality and care quality by increasing Medicaid reimbursement to nursing homes with stipulations about nursing assistants' compensation.[88] Other states have set requirements for the percentage of nursing home revenue that must be invested in resident care, including wages and other job quality measures.[89] Additional states have set minimum staffing requirements to overcome widespread understaffing in nursing homes, a strategy that is currently being pursued at the federal level.[90] In order to support nursing assistants and nursing home residents now and into the future, such efforts must be significantly expanded and sustained.

OCCUPATIONAL TITLES AND INDUSTRY CLASSIFICATIONS

OCCUPATIONAL TITLES

The direct care worker occupational categories used in this report are defined by the Standard Occupational Classification (SOC) system developed by the Bureau of Labor Statistics (BLS) at the U.S. Department of Labor (DOL). Under this classification system, workers are classified based on their on-the-job responsibilities, skills, education, and training. Occupation definitions can be found at: http://www.bls.gov/SOC. In practice, state regulations, employer norms, and other factors determine the roles and responsibilities associated with occupational titles in different settings.

TITLE	OTHER TITLES	JOB DESCRIPTION
Personal Care Aides (SOC 31-1122)	Caregiver, Home Care Aide, Personal Care Assistant, Personal Care Attendant, Resident Care Assistant	In addition to assisting with activities of daily living (ADLs), personal care aides often help with housekeeping, chores, meal preparation, and medication management. They may also help individuals engage in employment and/or community life, and provide advice on nutrition, household maintenance, and other activities.
Home Health Aides (SOC 31-1121)	Certified Home Health Aide, Home Hospice Aide, Home Health Attendant	In addition to assisting with ADLs, home health aides may also perform clinical tasks such as wound care, blood pressure readings, and range-of-motion exercises. Their work is supervised remotely or intermittently onsite by a licensed professional.
Nursing Assistants (SOC 31-1131)	Certified Nursing Assistant, Certified Nursing Aide, Nursing Attendant, Nursing Aide, Nursing Care Attendant, Medication Aide	Nursing assistants assist individuals with ADLs and may also perform certain clinical tasks under the onsite supervision of a licensed professional.

A NOTE ON OTHER OCCUPATIONAL TITLES

Two other direct care occupations have distinct on-the-job responsibilities, but do not have their own federal occupation codes.

Independent providers are home care workers who are employed directly by older adults, people with disabilities, or their families through publicly funded consumer-direction programs or using private funds. Their roles may include a mix of personal care and health monitoring and maintenance tasks, depending on the needs and preferences of the individuals who employ them. Due to a 2017 methodological change, a proportion of independent providers hired through consumer-direction programs are now captured by the Bureau of Labor Statistics (BLS) Occupational Employment and Wage Statistics (OEWS) program.[91] However, the accuracy of these data varies by state and many independent providers are likely excluded. More broadly, these data do not include home care workers who are hired directly and paid out-of-pocket by consumers through the "gray market."[92]

Direct support professionals provide habilitation services, employment assistance, and other supports to people with intellectual and developmental disabilities.[93] They are included in BLS data and other public datasets (unless they are employed directly by consumers or their families in the "gray market"), but because they do not have their own federal occupation code, they are combined with other direct care workers and are not separately quantifiable.

INDUSTRY CLASSIFICATIONS

Long-term care industries are defined by the North American Industry Classification System (NAICS) developed by the Office of Management and Budget (OMB). Business establishments are coded based on their primary activity. Industry definitions can be found at: https://www.census.gov/eos/www/naics/.

TITLE	EXAMPLES	INDUSTRY DESCRIPTION
Home Care		
Home Health Care Services (NAICS 621610)	Home Health Care Agencies, Visiting Nurse Associations, In-Home Hospice Care Services	This industry comprises establishments that provide personal care, homemaking, and companionship services. These establishments also provide skilled nursing care and a range of other home-based medical services.
Services for the Elderly and Persons with Disabilities (NAICS 624120)	Non-Medical Home Care Providers, Homemaker Service Providers, Self-Help Organizations, Companion Service Providers, Adult Day Care Centers, Activity Centers for Older Adults and People with Disabilities	This industry comprises establishments that provide social assistance services to improve the quality of life for older adults, people with intellectual and developmental disabilities, and people with physical disabilities who live in their homes and communities. Services include non-medical personal care and homemaker services.
Residential Care		
Continuing Care Retirement Communities and Assisted Living Facilities for the Elderly (NAICS 623310)	Assisted Living Communities, Continuing Care Retirement Communities, Residential Care Homes, Personal Care Homes	This industry comprises establishments primarily engaged in providing residential and personal care services for older adults and people with disabilities. The care typically includes room, board, supervision, and assistance with daily tasks and activities.
Residential Intellectual and Developmental Disability Facilities (NAICS 623210)	Group Homes, Intermediate Care Facilities, Residential Care Homes, Homes for Individuals with Intellectual and Developmental Disabilities	This industry comprises establishments primarily engaged in providing residential care services for people with intellectual and developmental disabilities. These communities may provide some health care, though their focus is room, board, protective supervision, and counseling.
Nursing Homes		
Nursing Care Facilities (Skilled Nursing Homes) (NAICS 623110)	Skilled Nursing Facilities, Nursing Homes, Rest Homes with Nursing Care, Retirement Homes with Nursing Care, Group Homes for People with Disabilities with Nursing Care, Homes for the Aged with Nursing Care, Inpatient Hospice	This industry comprises establishments that are primarily engaged in providing 24-hour nursing, rehabilitative, and personal care services. These establishments have a permanent core staff of registered and licensed practical/vocational nurses who provide care along with nursing assistants and other staff.

DATA SOURCES AND METHODS

Hourly wage and employment data were sourced from the Bureau of Labor Statistics (BLS) Occupational Employment and Wage Statistics (OEWS) program and employment projections were sourced from the BLS Employment Projections Program (EPP). While nursing assistant wage data were drawn directly from the OEWS, home care worker and residential care aide wages were calculated as a weighted average of median hourly wages for each occupation in each industry. Median wages are preferable to mean wages in these calculations, since mean wages may be skewed by a small proportion of atypically high-paid workers. The Consumer Price Index for All Urban Consumers (Current Series) was used to adjust wages for inflation to 2022 dollars.

The U.S. Census Bureau's American Community Survey (ACS) and Current Population Survey (CPS) were used to calculate workforce demographics, parental status, full-time/part-time status, median annual earnings, poverty rate, use of public assistance, health insurance coverage, and access to affordable housing. The U.S. Census Bureau's American Time Use Survey (ATUS) pooled years of data from 2011-2021 were used to estimate the percentages of direct care workers and all U.S. workers that provide unpaid family caregiving for one or more older adults.

For nursing assistants in nursing homes specifically, Payroll-Based Journal data from the Centers for Medicare & Medicaid Services (CMS) were used to analyze staffing, including use of contract CNA staff, hours per resident day, medication aide employment, and residents per nursing assistant. To estimate the ratio of residents to nursing assistants, we divided the number of residents in each nursing home by the estimated number of full-time equivalent (FTE) nursing assistants. We estimated the number of FTE positions by dividing total daily nursing assistant hours by three (the typical number of shifts in a day) and eight (the number of hours in a full-time shift).

ABOUT PHI

PHI works to transform eldercare and disability services. We foster dignity, respect, and independence for all who receive care, and all who provide it. As the nation's leading authority on the direct care workforce, PHI promotes quality direct care jobs as the foundation for quality care.

Drawing on more than 30 years of experience working side-by-side with direct care workers and their clients in cities, suburbs, and small towns across America, PHI offers all the tools necessary to create quality jobs and provide quality care. PHI's trainers, researchers, and policy experts work together to:

- Learn what works and what doesn't in meeting the needs of direct care workers and their clients, in a variety of long-term care settings;
- Implement best practices through hands-on coaching, training, and consulting, to help long-term care providers deliver high-quality care;
- Support policymakers and advocates in crafting evidence-based policies to advance quality care.

AVI Risk Services

Your Workers' Compensation Claims & Risk Management Solution

PENNSYLVANIA
HOME CARE AND HUMAN SERVICES
WORKERS' COMPENSATION TRUST

Pennsylvania Home Care & Human Services Workers' Compensation Trust

About Us

AVI Risk Services is a full service individual and group Program Administrator for Self-Insured Workers' Compensation as well as offering Third-Party Administrative and Claims Management Services (TPA). Since its inception in 1991, AVI Risk Services has offered Self-Insurance, Large Deductible Programs, consulting, and brokerage services. AVI uniquely combines insurance and risk management strategies in the insurance marketplace to deliver innovative, cost-effective solutions in Workers' Compensation, Risk Management, and Safety & Loss Control. We currently administer and manage Self-Insurance Group Programs consisting of auto dealers, trucking, social services, food processors, and entertainment clients.

Pennsylvania Home Care & Human Services Workers' Compensation Trust

Pennsylvania Home Care & Human Services Workers' Compensation Trust (PAHC) was formed in 2008. The group includes employers in the home care and human services industry.

A Board of Trustees selected from the PAHC's membership provides oversight of the program. PAHC is approved and regulated by the Pennsylvania Department of Labor & Industry Bureau of Workers' Compensation.

PAHC is selective in their membership and only employers committed to safety and loss control are considered. Prospective members undergo a thorough underwriting process before an offer of membership is extended.

THE SUCCESS AND GROWTH OF PAHC IS THE RESULT OF SAFETY CONSCIOUS EMPLOYERS WORKING HAND IN HAND WITH AN EXPERIENCED PROGRAM ADMINISTRATOR AND AGGRESSIVE CLAIMS MANAGEMENT.

Group Program Benefits

AN INNOVATIVE APPROACH TO WORKERS' COMPENSATION INSURANCE FOR THE HOME CARE AND HUMAN SERVICES INDUSTRY

- Lower rates than traditional insurance or the State Fund (as much as 20%)
- Long term rate stability with potential return of contribution
- Self-Insured program owned by the members and managed by the Board of Trustees
- Approved and regulated by the PA Dept. of Labor & Industry Bureau of Workers' Compensation
- Experienced and dedicated claims and safety staff with expertise in the home care industry
- State certified, industry specific safety and loss control programs
- Excess insurance coverage provided by an "A" rated national insurance carrier
- Synergy of being in a group of similar employers that can spark ideas and facilitate solutions to industry related problems
- Endorsed by the Pennsylvania Homecare Association

TUBERCULOSIS SCREENING

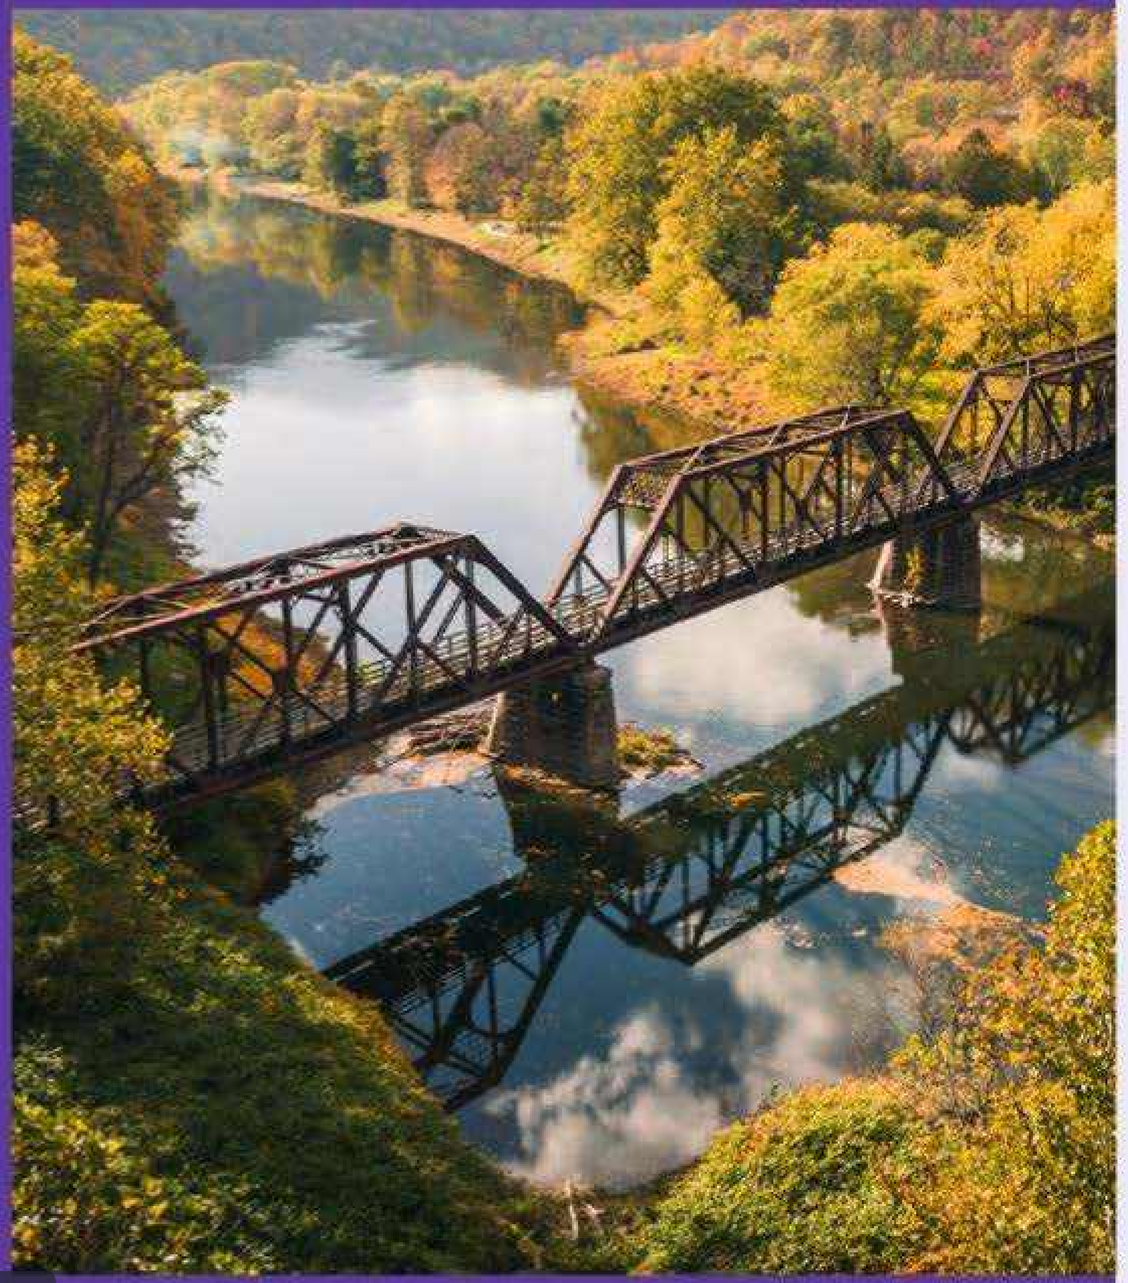
September 18, 2024

PHA

PENNSYLVANIA HOMECARE ASSOCIATION

Agenda

- **Initial Baseline**
  1. Risk Assessment
  2. Symptom Evaluation
  3. TB Education
  4. TB Testing
     - TB Skin Test
     - TB Blood Test
     - Test Results
     - Chest X Rays
- **Annual Requirements**



TUBERCULOSIS

Tuberculosis (TB) is A contagious infection caused by bacteria that mainly affects the lungs but can also affect any other organ including bone, brain and spine. TB is a disease that is spread through the air from one person to another.

On May 17, 2019 the Centers for Disease Control and Prevention (CDC) issued updated recommendations for TB testing of health care personnel.

These recommendations are summarized in this PowerPoint.

TB Initial Baseline

The following must be completed with results received PRIOR to direct patient contact:

1. Individual risk assessment

2. Individual symptom evaluation

3. Tuberculosis Education

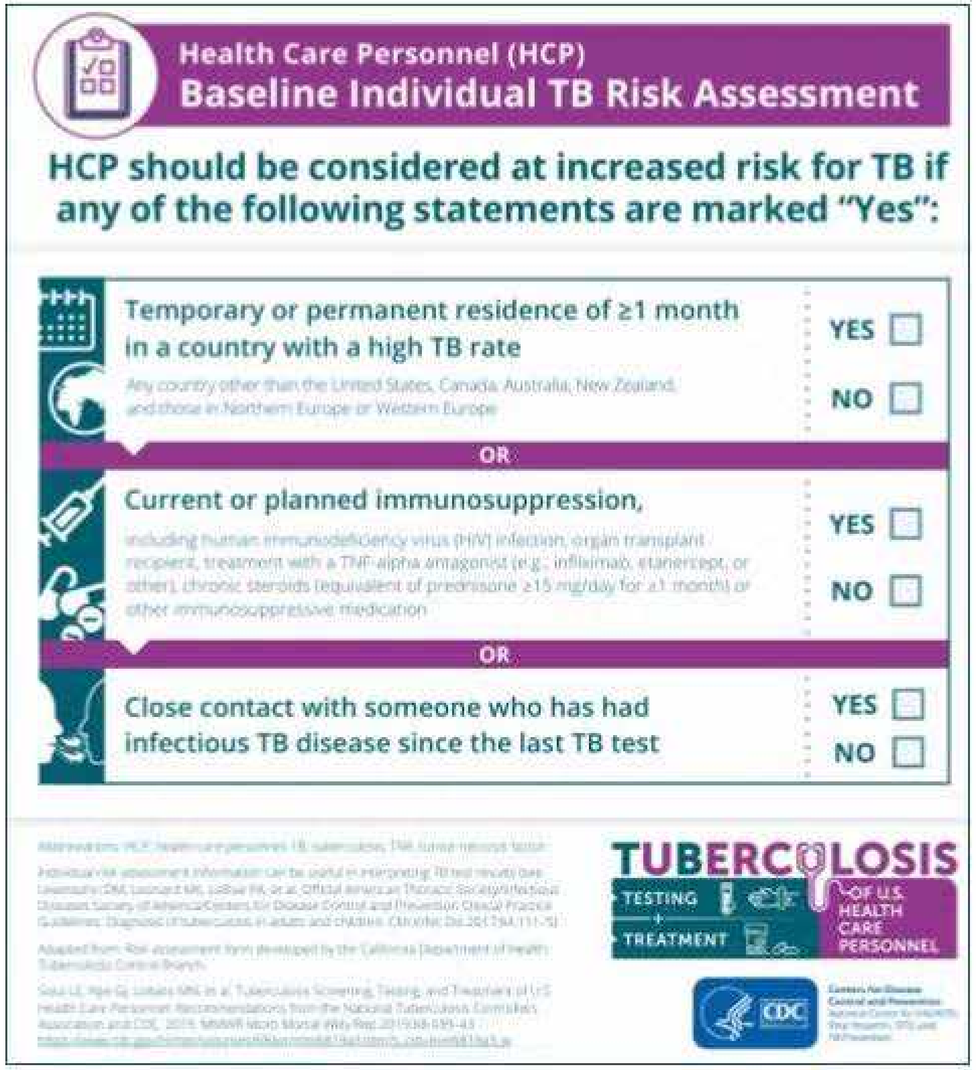
4. TB Testing:
   - TB Skin Test
     (abbreviated TST, also known as PPD for purified protein derivative)

     OR

   - TB Blood Test
     *(also known as interferon-gamma release assays or IGRAs, or BAMT, or **QuantiFERON**)*

PHA PENNSYLVANIA HOMECARE ASSOCIATION

Individual Risk Assessment



Health Care Personnel (HCP)

Baseline Individual TB Risk Assessment

HCP should be considered at increased risk for TB if any of the following statements are marked "Yes":

Temporary or permanent residence of ≥1 month in a country with a high TB rate

Any country other than the United States, Canada, Australia, New Zealand, and those in Northern Europe or Western Europe

YES ☐ NO ☐

OR

Current or planned immunosuppression,

including human immunodeficiency virus (HIV) infection, organ transplant recipient, treatment with a TNF-alpha antagonist (e.g., infliximab, etanercept, or other), chronic steroids (equivalent of prednisone ≥15 mg/day for ≥1 month) or other immunosuppressive medication

YES ☐ NO ☐

OR

Close contact with someone who has had infectious TB disease since the last TB test

YES ☐ NO ☐

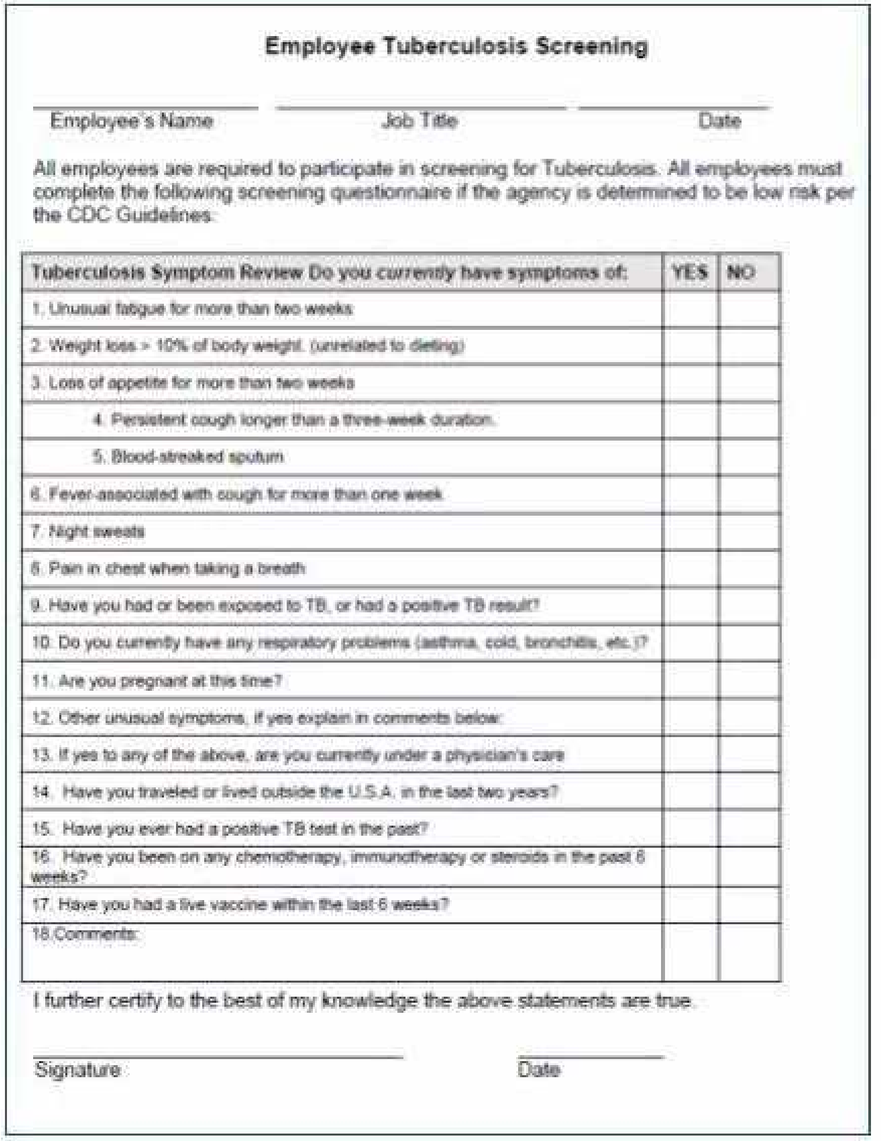
Individual Symptom Evaluation



Employee Tuberculosis Screening

Employee's Name _____ Job Title _____ Date _____

All employees are required to participate in screening for Tuberculosis. All employees must complete the following screening questionnaire if the agency is determined to be low risk per the CDC Guidelines.

Tuberculosis Symptom Review Do you *currently* have symptoms of:	YES	NO
1. Unusual fatigue for more than two weeks		
2. Weight loss > 10% of body weight. (unrelated to dieting)		
3. Loss of appetite for more than two weeks		
4. Persistent cough longer than a three-week duration.		
5. Blood-streaked sputum		
6. Fever-associated with cough for more than one week		
7. Night sweats		
8. Pain in chest when taking a breath		
9. Have you had or been exposed to TB, or had a positive TB result?		
10. Do you currently have any respiratory problems (asthma, cold, bronchitis, etc.)?		
11. Are you pregnant at this time?		
12. Other unusual symptoms, if yes explain in comments below:		
13. If yes to any of the above, are you currently under a physician's care		
14. Have you traveled or lived outside the U.S.A. in the last two years?		
15. Have you ever had a positive TB test in the past?		
16. Have you been on any chemotherapy, immunotherapy or steroids in the past 6 weeks?		
17. Have you had a live vaccine within the last 6 weeks?		
18.Comments:		

I further certify to the best of my knowledge the above statements are true.

Tuberculosis Education

Keep Documentation that an applicant/employee completed training in Tuberculosis.

Optional educational material can be found at:

- Department of Health TB Training Video: https://www.youtube.com/watch?v=wA_fObLY6GE
- CDC TB Coursework for Health Care Workers: TB 101 - Main Menu | TB | CDC
- Department of Health TB resource library: TB Providers | Department of Health | Commonwealth of Pennsylvania

PHA PENNSYLVANIA HOMECARE ASSOCIATION

TB Skin Test (TST, PPD)

No Prior Testing

1. A 2 step TB Skin Test (TST), or PPD, may be administered by a Registered Nurse, License Practical Nurse, Certified Clinical Medical Assistant, Physicians Assistant, Physician, or CRNP with an active professional license. For purpose of this policy these will be known as "Certified Practitioner"
2. **An applicant or employee may not begin to work with patients until both steps of the PPD have been read by the Certified Practitioner and deemed negative.**
3. The TB skin test, or PPD, must be administered in the applicant or employee's forearm. For a 2-step screening, both the left arm and right arm should be utilized, one for each step of the screening.
4. All PPD steps must be read by a Certified Practitioner 48-72 hours following the date the PPD was administered. If this deadline is missed, the PPD step may not be considered to meet this protocol.
5. The second PPD step must be performed within 1 – 3 weeks of the date the 1st step of the PPD was read. If this deadline is missed, you must do an additional 2 steps within approved deadlines to meet this requirement.

PHA PENNSYLVANIA HOMECARE ASSOCIATION

TB Skin Test (TST, PPD)

With Prior Testing

If an applicant had a 2 step TST/PPD within the 12 months prior to hire, no further testing is required.

If an applicant had a 1 step TST/PPD within the 12 months prior to hire, a one step TST/PPD should be administered according to the policy on the previous slide.

PHA PENNSYLVANIA HOMECARE ASSOCIATION

TB Blood Test

No Prior Testing

- If an applicant has no previous TB testing, at the time of hire, the applicant may have a blood test performed to evaluate for Tuberculosis.
- QuantiFERON (QFT) is an interferon-γ release assay (IGRA) that aids in the evaluation of tuberculosis infections and is recommended by the CDC as an alternative to the tuberculin skin test (TST). This alternative offers more accurate and quicker results.
- For the test, a health care worker/Certified Practitioner will take some blood (less than a teaspoon) from your vein. The blood is then sent to a lab for testing.
- **An applicant or employee may not begin to work with patients until a negative result is received and on file.**

PHA PENNSYLVANIA HOMECARE ASSOCIATION

TB Blood Test

With Prior Testing

If an applicant had a documented negative blood test within the 12 months prior to hire, no further testing is required.

PHA PENNSYLVANIA HOMECARE ASSOCIATION

Test Results

A negative TB skin or blood test means the person's body did not react to the test, and that latent TB infection or TB disease is not likely.

A positive TB skin test or TB blood test only tells that a person has been infected with TB bacteria. It does not tell whether the person has latent TB infection (LTBI) or has progressed to TB disease. In cases where a person has a positive TB skin or blood test, additional testing will be required, such as a chest x-ray.

If a TB Skin Test/TB Blood Test AND chest x-ray are positive, the agency must contact the PA Department of Health for required exposure follow-up.

PHA PENNSYLVANIA HOMECARE ASSOCIATION

Chest X-Ray

- Evidence of a previous negative chest x-ray may be accepted if it was performed as a result of a history of positive/false positive TB skin test and/or TB blood test OR if a TB Skin Test or TB Blood Test was inconclusive.

- There are no time restrictions on chest x-rays, meaning you do not need to repeat chest x-rays there is potential exposure/symptoms at which time you should consulta physician.

- The chest x ray must indicate “no evidence of TB”.

- In this scenario, the employee may begin to work immediately with patients. However, the risk assessment and symptom evaluation must be documented and on file in addition to the x-ray results PRIOR to patient contact.

PHA PENNSYLVANIA HOMECARE ASSOCIATION

Annual (every 12 months) Individual Requirements

The Following Are Required Annually/Every 12 months:

1. TB Education
2. Individual Risk Assessment
3. Symptom Evaluation

- TB Skin Test/TB Blood Test is not required **unless** there is a known exposure to TB or if there is ongoing transmission within the health care facility

VP of Sales

Vitable

Vitable was founded specifically for *Home Cares* frustrated with expensive and complex TB Testing and Health Benefits

Problem

Current State

- Current process typically involves 2-step TB Testing
- Caregivers are responsible for getting referral, paying for test, and bringing results back to you
- This causes delays with onboarding new caregivers which leads to bottleneck in filling cases
- Billable hours are slowed, affecting revenue growth

Future State

- 1-step TB Testing implemented
- Caregivers are provided referral and instructions on where to get tested with no cost to them
- Results are automatically delivered electronically directly to you
- Onboarding delays are cut in half, leading to more billable hours and increased cases filled

TB Testing

Accepted methods

QuantiFERON-GOLD

- Only 1 visit needed
- Electronic results delivered to you
- 3-5 day turnaround
- Not affected by BCG vaccine (false positive)
- Does not cause boosting

2-Step PPD

- 2 visits required for each step (4 total)
- High no-show rate
- False positives with BCG vaccine
- Manual placement, reading, and data entry
- Causes boosting that affects future testing

X-Ray

- 1 visit with limited options
- Early stage TB hard to detect
- Radiation exposure
- Outdated method

Simplified TB Testing

Accessible Locations

Access to over **1,000** Quest and LabCorp locations

Quest Diagnostics labcorp

Get Results Faster

Automated lab order creation with a **3-5** business day results turnaround

Home Care Grant

About

The Pennsylvania Foundation for Home Care and Hospice has established the **Home Care Grant** to support home-based care agencies in providing temporary care to individuals who demonstrate a need for home and community-based services, but are not yet receiving, are waiting to be approved/renewed, or are not eligible for services through other payment programs, such as Medicaid. *Note that a consumer may receive certain OPTIONS benefits and still be eligible for grant funding.*

If selected as a grant recipient, agencies will be granted access to funds of up to $1,250 per client to be used as 50 hours of non-medical home care services at $25/hour *or* 10 medical home health visits at $125/visit.

All fund disbursements are at the sole discretion of the Pennsylvania Foundation for Homecare and Hospice.

Please note, agencies are limited to two (2) referrals per month and should reserve referrals for clients with the highest need level. A client is eligible for funding once per calendar year.

For more information and to download/print application materials visit www.pahomecare.org/foundation

Eligibility

- Individuals who temporarily or permanently reside in the Commonwealth of Pennsylvania
- Individuals who demonstrate a need for home-based care services, which includes home care, home health, and hospice services
- Individuals with monthly income less than $5,000 (single) or $10,000 (dual income, including spouse/partner, excluding any child income)*
- Individuals who are not currently receiving comparable home-based care services through the following programs:
  - Any Pennsylvania Medicaid Waiver Program (including managed care programs)
  - Veterans receiving home health care benefits through the Aide and Attendance Program
  - Any other similar program as determined by the Foundation

**Income limits and other terms and conditions are subject to change, at the sole discretion of The Foundation.*

PHA PENNSYLVANIA HOMECARE ASSOCIATION

How To

Record Your Own "*Mission Moment*"

Before You Record

Take a moment and gather a story. This is meant to be fun, sharing, and personal; relax!
We're all human with unique stories to share.

We're looking for a personal story of someone who touched your life or a real-life event that changed you. Please think of this as a narrative; a story (with real people and places) showcasing the power of helping people and what we do daily in personal care services.

Keep recordings under 1:30 minutes per clip. You can take as many takes as you'd like!

Recording With a Cell Phone

1. Place the phone at eye-level.
    - Make sure the phone is sturdy & stationary, prop it up on a few books or on top of a box that you can place on your desk. (*NO walking and talking!)
2. Please have the camera sideways or horizontally (We cannot use vertical video).
3. Please make sure your video camera settings are correct, please record 4K video.
    - iPhone: go to Settings > Camera > Record Video > (select 4K at 30 fps)
    - Android: While in video mode, swipe down from the top of the screen to open settings, change the resolution to 4K
4. Ideally, select a neutral background behind you.
    - For example, have a blank wall with a plant in the corner behind you.
    - Sit in front of something where YOU stand out in the foreground.
5. Have soft light in front of you, hitting your face.
    - Have a window with daylight in front of you OR position a desk lamp in front of you which will cast soft light onto your face.
    - Do not have bright light or an open window with daylight behind you.
6. ***IMPORTANT!**
    - When you hit record, count to three (ONE, TWO, THREE) and deep breathe before you start talking – then, share your name and your role as a caregiver. Highlight a specific benefit or experience with PHA.
    - Express gratitude and explain why PHA is important to you.
    - When you're finished, pause, and count to three (ONE, TWO THREE) before hitting the stop record button.
    - This will give us enough video for a fade in / out at the beginning and end.

Sending Your Video

Use the **QR Code** to the right to upload your video to our DropBox account
OR **email** your video to yourpartner@pahomecare.org

THANK YOU! You are the heart of our profession. Home is where the healing happens. It's where patients want to be, where they feel most comfortable, most secure, and most connected to their communities. We appreciate YOUR commitment to making this a reality for so many in our community! And we appreciate you sharing your voice.

Home Care Grant

About

The Pennsylvania Foundation for Home Care and Hospice has established the **Home Care Grant** to support home-based care agencies in providing temporary care to individuals who demonstrate a need for home and community-based services, but are not yet receiving, are waiting to be approved/renewed, or are not eligible for services through other payment programs, such as Medicaid. *Note that a consumer may receive certain OPTIONS benefits and still be eligible for grant funding.*

If selected as a grant recipient, agencies will be granted access to funds of up to $1,250 per client to be used as 50 hours of non-medical home care services at $25/hour *or* 10 medical home health visits at $125/visit.

All fund disbursements are at the sole discretion of the Pennsylvania Foundation for Homecare and Hospice.

Please note, agencies are limited to two (2) referrals per month and should reserve referrals for clients with the highest need level. A client is eligible for funding once per calendar year.

For more information and to download/print application materials visit www.pahomecare.org/foundation

Eligibility

- Individuals who temporarily or permanently reside in the Commonwealth of Pennsylvania
- Individuals who demonstrate a need for home-based care services, which includes home care, home health, and hospice services
- Individuals with monthly income less than $5,000 (single) or $10,000 (dual income, including spouse/partner, excluding any child income)*
- Individuals who are not currently receiving comparable home-based care services through the following programs:
  - Any Pennsylvania Medicaid Waiver Program (including managed care programs)
  - Veterans receiving home health care benefits through the Aide and Attendance Program
  - Any other similar program as determined by the Foundation

**Income limits and other terms and conditions are subject to change, at the sole discretion of The Foundation.*

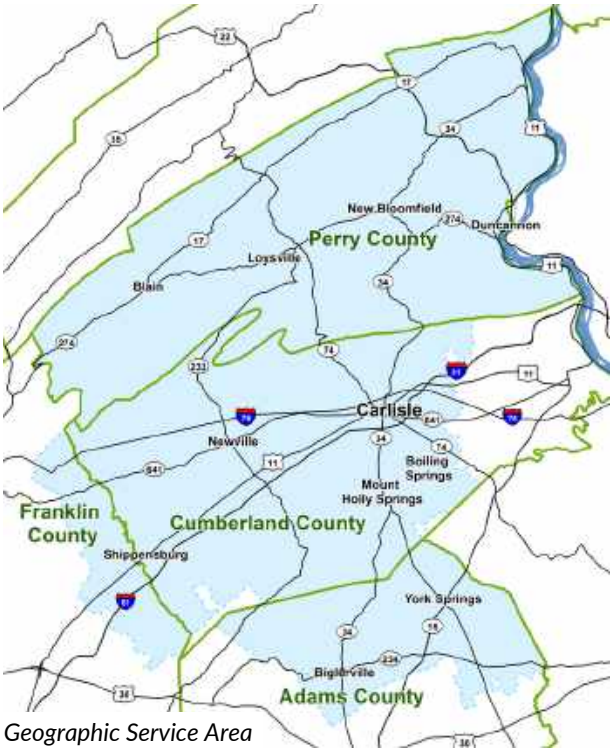
SOUTH CENTRAL PENNSYLVANIA HOME CARE GRANT

The Pennsylvania Foundation for Home Care and Hospice, through funding provided by the Partnership for Better Health, has established the **South Central Pennsylvania Home Care Grant** to support home-based care agencies in providing temporary care to individuals who demonstrate a need for home and community-based services, but are not yet receiving or eligible for services through other payment programs, such as Medicaid. *Note that a consumer may receive certain OPTIONS benefits and still be eligible for grant funding.*

If selected as a grant recipient, agencies are eligible for reimbursement of up to $2,500 per client, for up to 100 hours of non-medical home care services at $25/hour or 20 medical home health visits at $125/visit.

This grant is available to all home-based care providers that provide services to individuals in the eligible zip codes. There is no limit on the number of applications that can be submitted per agency. A client is eligible for funding once every calendar year.

All fund disbursements are at the sole discretion of the Pennsylvania Foundation for Homecare and Hospice. Funding for the South Central Pennsylvania Home Care Grant was provided by the Partnership for Better Health.



Geographic Service Area

Eligible Zip Codes:
17006;17020;17024;17037;17040;17045;17047;17053;17062;17068;17069;17071;17074;17090;17303;17304;17306;17307;17316;17324;17337;17372;17007;17013;17015;17065;17081;17240;17241;17257;17266

ELIGIBILITY

- **Individuals who temporarily or permanently reside in the Partnership for Better Health service area, which includes parts of Cumberland, Perry, Adams, and Franklin Counties.** ***Refer to the map and zip codes listed above.***
- Individuals who demonstrate a need for home-based care services, which includes home care, home health, and hospice services
- Individuals with monthly income less than $5,000 (single) or $10,000 (dual income, including spouse/partner, excluding any child income)*
- Individuals who are not currently receiving, are waiting to be approved/renewed, or are not eligible for comparable home-based care services through the following programs:
  - Any Pennsylvania Medicaid Waiver Program (including managed care programs)
  - Veterans receiving home health care benefits through the Aide and Attendance Program
  - Any other similar program as determined by the Foundation

**Income limits and other terms and conditions are subject to change, at the sole discretion of the Foundation.*

Job Titles for Organic Visibility

To enhance job titles for better organic visibility, it's essential to focus on both search engine optimization (SEO) and user engagement. Here are some key tips:

- **Use Relevant Keywords:** Incorporate industry-specific terms and keywords that potential candidates are likely to search for. For example, instead of just "Home Health Nurse" use "Home Health Registered Nurse (RN)" or "Private Duty Licensed Practical Nurse (LPN)."
- **Be Specific and Descriptive:** Clearly define the role in the job title.
- **Keep It Concise:** Aim for a job title that is clear and to the point. Long titles can be confusing and may not display well in search results.
- **Include Job Level:** Indicate the level of the position, such as "Junior," "Senior," or "Lead." This helps attract candidates with the appropriate experience.

- **Test and Optimize:** Regularly review and adjust job titles based on performance metrics. Use tools like Google Analytics to see which titles attract the most views and applications.
- **Avoid:** Use commonly understood terms rather than internal jargon or overly creative titles that might not be recognized by search engines or job seekers. Avoid using urgency words, enticements to apply, general click bait, symbols, or bonus information, as these can negatively impact organic search rankings.

Formula for success:

Title + Commonly Known Abbreviation + Industry or Department

This formula can be used in any order you see best. Just be sure to keep it consistent

Examples:

- Home Care Coordinator - Senior Services
- Home Health Registered Nurse (RN) - Pediatrics
- Hospice Care Manager - Palliative Services
- Direct Care Worker (DCW) - Home Care
- Home Health Aide (HHA)
- Home Health Physical Therapist (PT) - Rehabilitation
- Hospice Medical Social Worker (MSW)
- Home Health Occupational Therapist (OT) - Stroke Recovery
- Home Care Registered Nurse (RN) - Chronic Illness Management
- Caregiver - Home Care
- Home Health Licensed Practical Nurse (LPN) - Geriatrics

By following these guidelines, you can improve the visibility and attractiveness of your job titles, making it easier to attract qualified candidates.

Job Titles for Organic Visibility

To optimize job titles for organic visibility, it's important to consider both search engine optimization (SEO) and user engagement. Here are some key tips:

- **Use Relevant Keywords:** Incorporate industry-specific terms and keywords that potential candidates are likely to search for. For example, instead of just "Home Health Nurse" use "Home Health Registered Nurse (RN)" or "Private Duty Licensed Practical Nurse (LPN)."
- **Be Specific and Descriptive:** Clearly define the role in the job title.
- **Keep It Concise:** Aim for a job title that is clear and to the point. Long titles can be confusing and may not display well in search results.
- **Include Job Level**: Indicate the level of the position, such as "Junior," "Senior," or "Lead." This helps attract candidates with the appropriate experience.
- **Test and Optimize:** Regularly review and adjust job titles based on performance metrics. Use tools like Google Analytics to see which titles attract the most views and applications.
- **Avoid:** Use commonly understood terms rather than internal jargon or overly creative titles that might not be recognized by search engines or job seekers. This includes urgency words, enticements to apply, general click bait, symbols, bonus information, etc. These can get flagged in organic search engines.

Example Job Titles

Formula for success: Title + Commonly Known Abbreviation + Industry or Department

- Home Care Coordinator - Senior Services
- Home Health Registered Nurse (RN) - Pediatrics
- Pediatric Home Health Licensed Practical Nurse (LPN)
- Hospice Care Manager - Palliative Services
- Direct Care Worker (DCW) - Home Care
- Home Health Aide (HHA)
- Home Health Physical Therapist (PT) - Rehabilitation
- Hospice Medical Social Worker (MSW)
- Home Care Director
- Home Health Occupational Therapist (OT) - Stroke Recovery
- Home Care Registered Nurse (RN) - Chronic Illness Management
- Personal Care Assistant (PCA) - Home Care
- Home Health Licensed Practical Nurse (LPN) - Geriatrics

This formula can be used in any order you see best. Just be sure to keep it consistent

Indeed

Indeed stands as the premier job aggregator in the market. It serves as an all-encompassing platform for employers, offering extensive exposure to prospective candidates and streamlining the job posting process. Indeed equips employers with invaluable tools such as screener questions and skills assessments. It excels in sourcing candidates for entry-level and lower-tier roles. With its wide recognition and usage across diverse industries, Indeed has become an indispensable resource for employers aiming to fill a spectrum of positions.

01

Claim your Indeed Page: Allows companies to build their employer brand, increase visibility, and attract qualified applicants. Customize your Company Page to showcase your company culture, work environment, mission, values, and benefits.

02

Job Postings: Organic postings are free. They are placed based on keyword relevancy, then by chronological order. Sponsored postings are paid ads. Sponsored jobs are given “premium placement” in search results. and will yield more candidates.

03

Smart Sourcing: AI-powered tool that matches quality candidates to your job, streamlining the hiring process. It offers instant candidate recommendations, customizable contact templates,

04

Virtual interviewing: allows seamless, hassle-free interviewing. It offers flexible interview options, reminders, tips for success, and features for effective interviewing, such as customizable welcome messages and resume previews

SIMPLYHIRED

SimplyHired is a valuable platform for employers, offering a wide reach by aggregating job listings from various sources. It allows free job postings and provides alerts when candidates apply, ensuring prompt responses. Employers can access an extensive resume database and only pay when they decide to proceed with a candidate. For increased visibility, job sponsorship is available.

The integration with Indeed enhances SimplyHired's offerings. This platform is particularly beneficial for high-volume recruitment, enabling employers to reach a large pool of potential candidates efficiently. SimplyHired is a strategic tool for attracting top talent.

Glassdoor

Glassdoor is another prominent job aggregator and employer branding site. It is recognized and used across diverse industries, Glassdoor has become an essential platform for employers looking to strengthen their brand and attract top talent..

Reviews

It offers unique tools like employee reviews and interview feedback, making it particularly useful for understanding company culture and work conditions from the employees' and past applicants' perspectives.

Job Ads

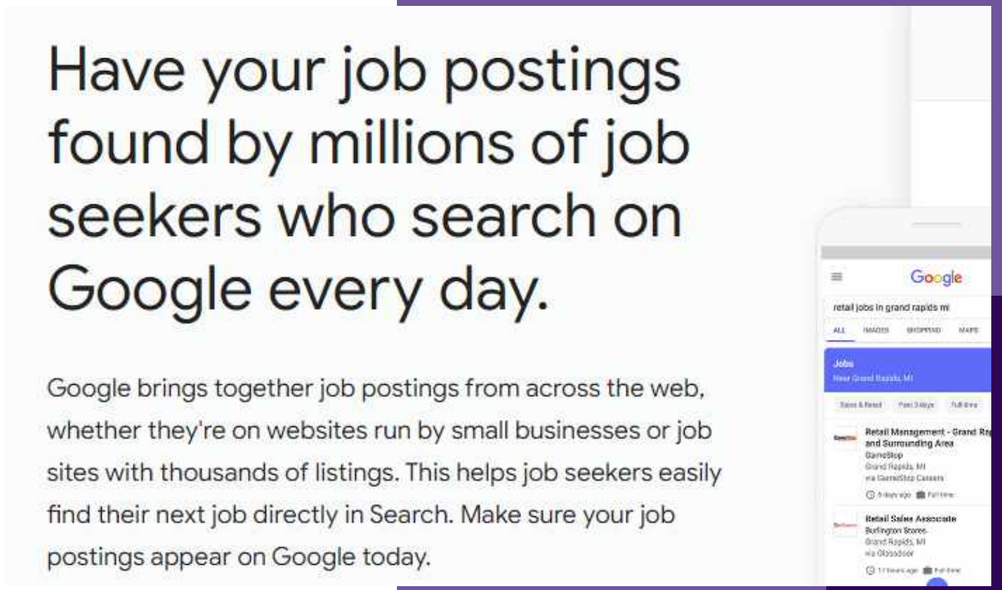
Any paid job posted on Indeed also gets posted on Glassdoor, increasing the reach of job postings.

Claim your page

Claiming your Glassdoor page allows control over your brand story, highlights your culture and benefits, and enables response to reviews.

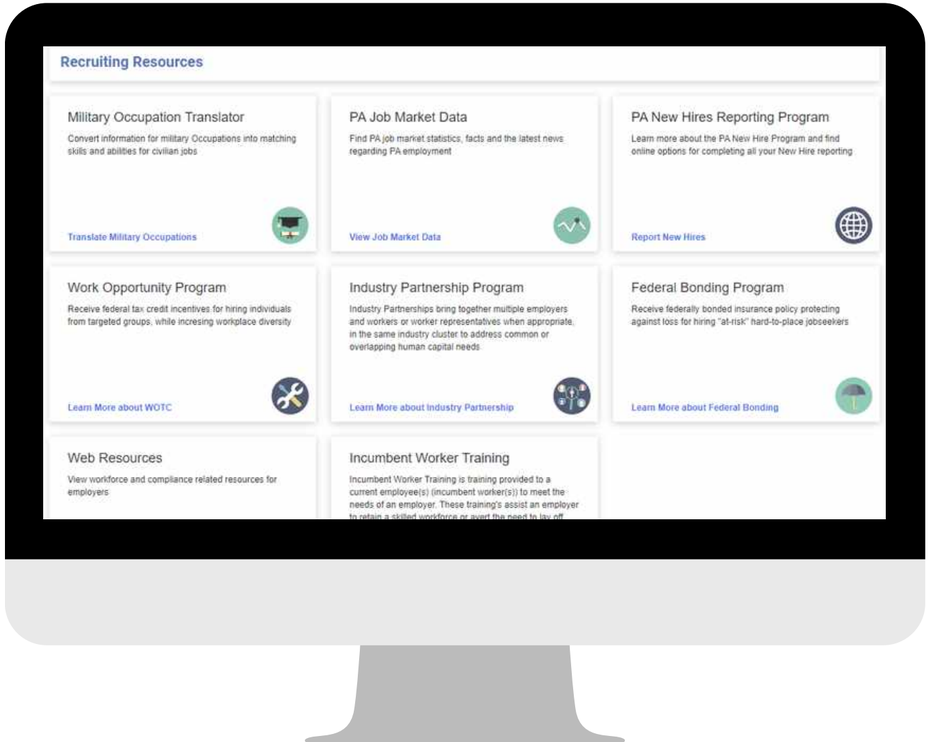
Google Jobs Network

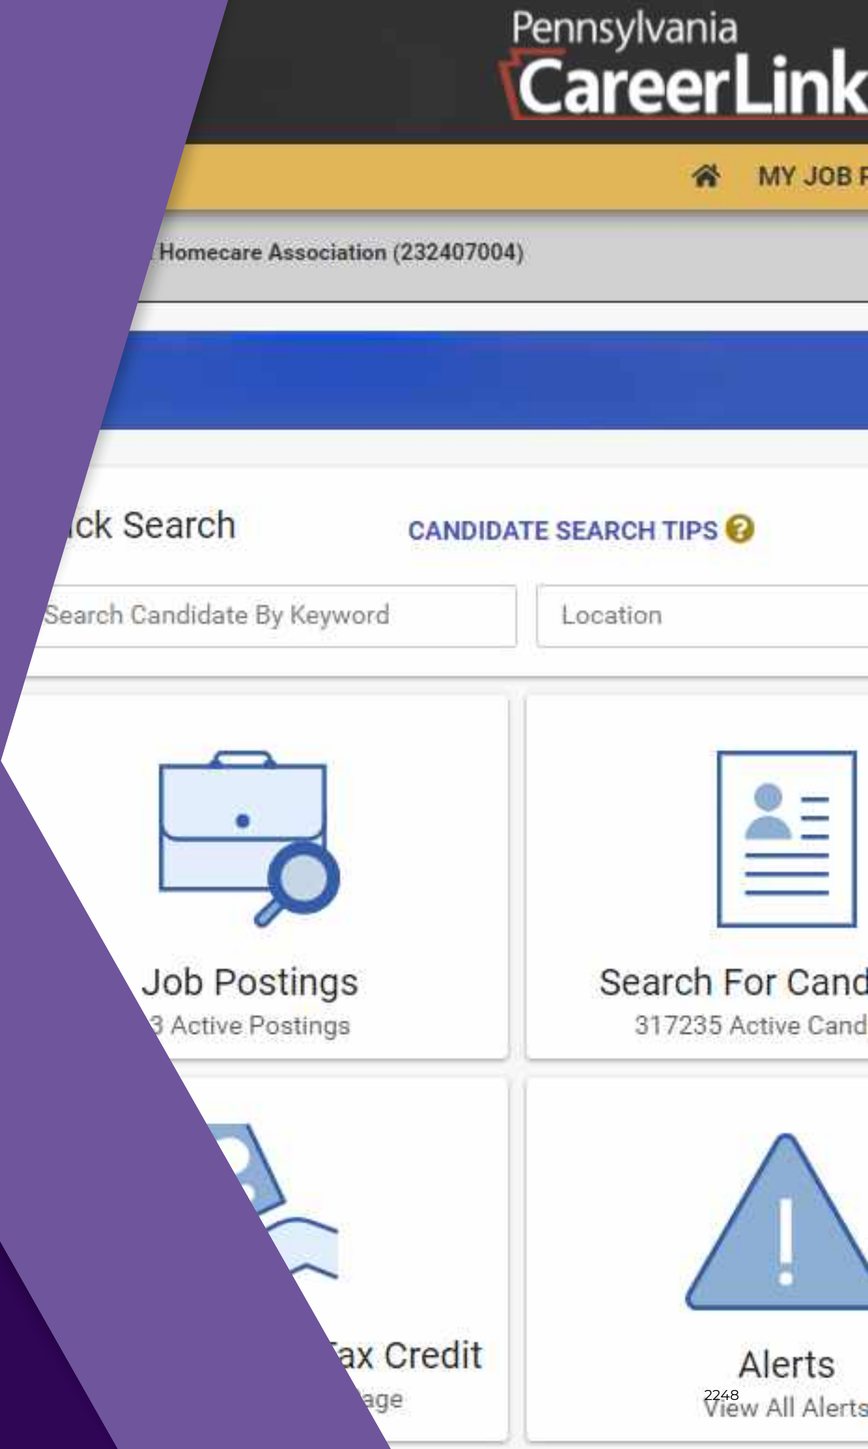
Google Job Networks is a powerful tool for employers. It aggregates job listings from across the web, including company websites and job boards. This broad reach helps employers attract a diverse pool of candidates. Employers can post jobs directly or through third-party job sites1. Google also offers structured data for job postings, enhancing visibility in search results



PA CAREERLINK

The PA CareerLink is a free service that aids employers with job posting, candidate search, and management. It offers recruitment assistance, including job posting creation, pre-screening, and candidate referrals. The platform supports diversity through the Work Opportunity Tax Credit program and provides training for current employees. It also fosters industry partnerships to bring together employers and workers in the same industry.





Body

myCNAjobs is a comprehensive platform for employers in the caregiving industry. It offers a suite of hiring, engagement, and training tools to facilitate high-volume recruitment1. Employers can advertise jobs, make hiring decisions, and connect with potential candidates. It's top rated in Senior Care ROI, providing trusted recruitment solutions. It's an effective resource for companies seeking to hire Certified Nursing Assistants (CNAs), Home Health Aides (HHAs), and caregivers.

MONSTER & CAREERBUILDER

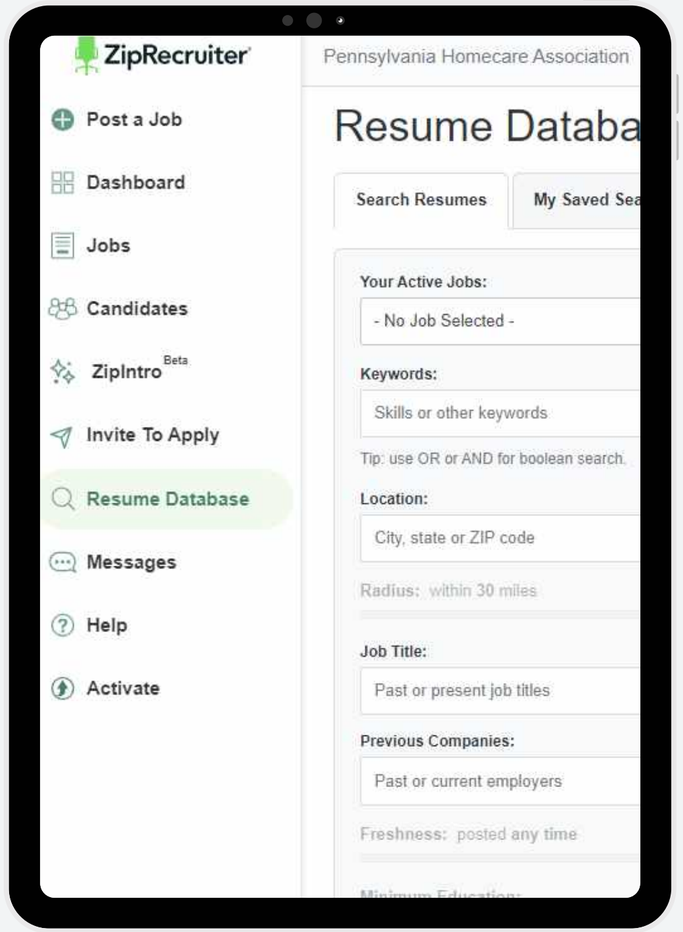
- **Paid Services:** Both offer different pricing plans to fit the needs of different businesses.
- **Job Postings:** Recruiters can post jobs on the sites, mobile app, and extensive network of job boards and partner sites.
- **Resume Searches:** Both allow recruiters to search through resumes to find potential candidates.
- **Applicant Tracking:** Both offer some applicant tracking functions.
- **Proactive Messaging:** Recruiters have the ability to proactively message qualified candidates.
- **Collaboration:** Both allow multiple team members to collaborate.

Contact **Samuel Harris** for inclusive trial pricing!
Sam.Harris@ziprecruiter.com | p: 480.401.3981

ZIPRECRUITER

ZipRecruiter is a **paid** online job posting platform. It allows employers to post job listings to over 100 job sites with one click.

The platform uses advanced AI-driven applicant matching technology to find candidates based on skills and experience. It also provides tools for screening and managing applicants, and tracking the success of job postings.



Evergreen Requisitions

Evergreen Requisitions are always open job postings for high volume, high turnover positions.

Benefits:

- Continuous Talent Pool: Ensures a steady pipeline of pre-screened candidates.
- Reduced Time-to-Fill: Speeds up the hiring process.
- Efficient Management: Groups jobs together for easier management.
- Reporting: Helps with tracking and analysis of high volume jobs.

Evergreen Requisitions are an efficient tool for quick staffing solutions.

The **PHA Job Board** is a niche platform designed specifically to recruit professionals in the home-based care sector.

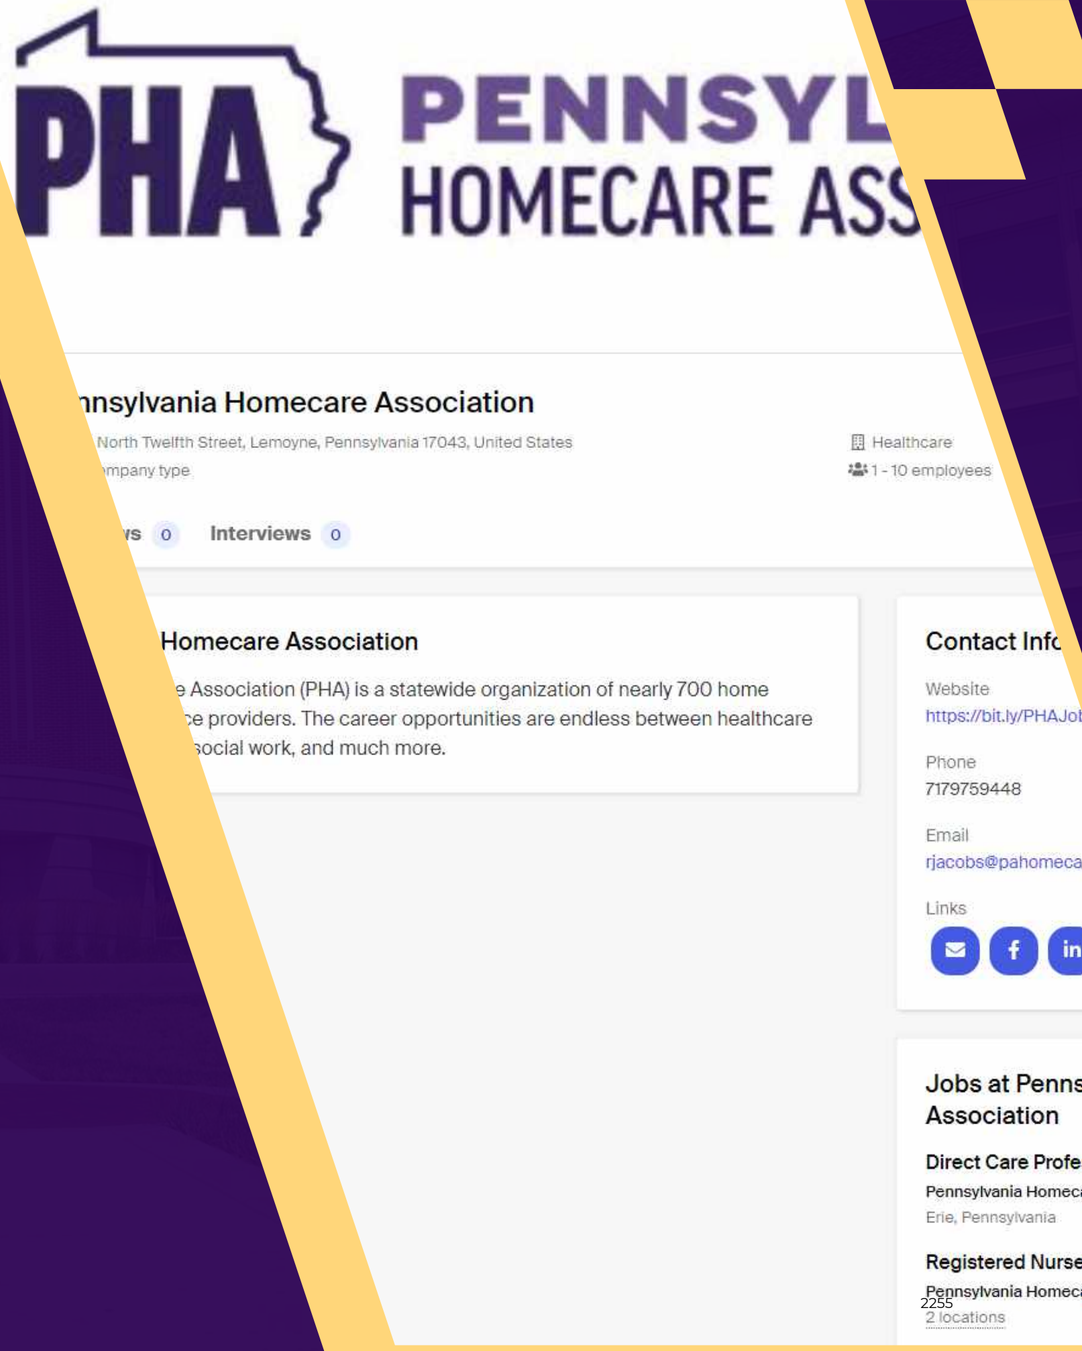
HANDSHAKE

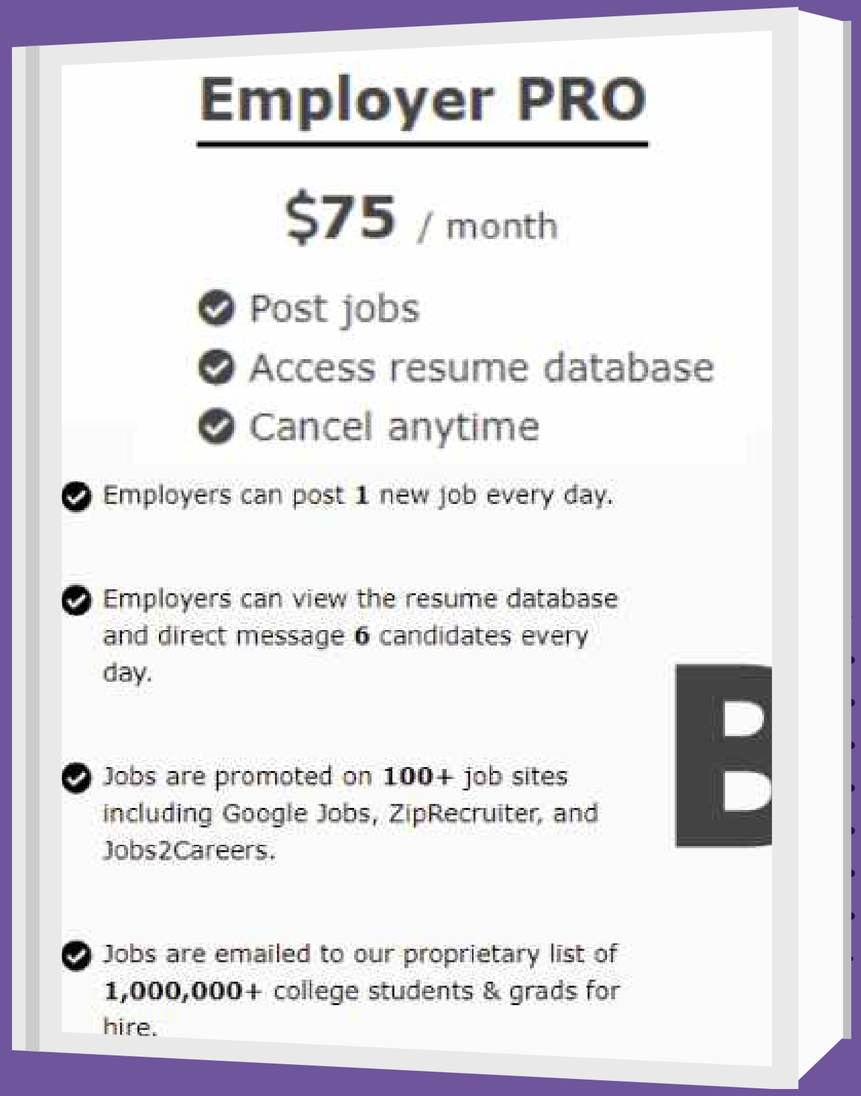
Handshake is a robust college recruitment platform tailored for employers seeking early-career talent. It's trusted by over 900K employers, including those in the healthcare sector. Handshake provides tools for brand promotion, sourcing talent, and scaling recruitment within the healthcare industry. It connects employers with 15M+ students and recent graduates from 90% of top US institutions, many of whom are pursuing healthcare-related careers. Employers can post jobs, collect resumes, identify potential candidates, and communicate with them directly. Handshake also provides a platform for hosting virtual and in-person job fairs and events, allowing employers to engage with potential candidates in a dynamic setting, thereby enhancing their recruitment process.



BAREFOOT STUDENT

Barefoot Student is an online community platform that connects university students and recent graduates with employers. It serves as a job board for student hiring, providing a comprehensive database of highly qualified students, graduates, and interns. This platform is particularly beneficial for small businesses seeking a one-stop job posting site. It's a valuable HR solution that simplifies the hiring process, making it easier to find and recruit talented interns and entry-level employees.

Free and Paid Job Advertisements

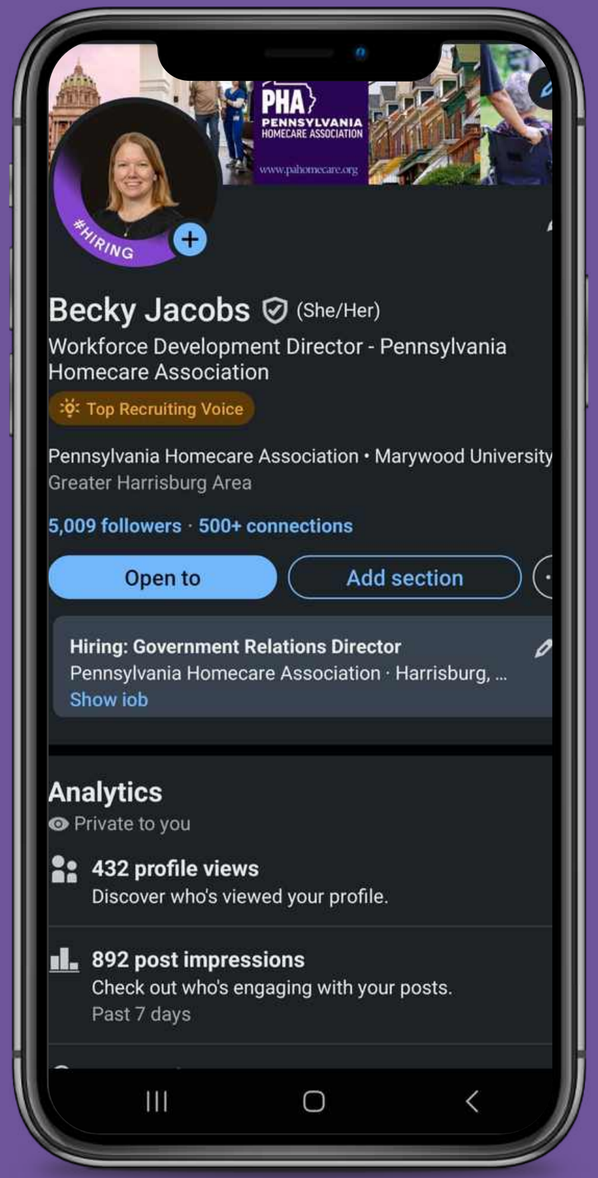


Vocational & High Schools

Creating career pathways from high schools and vocational schools involves a strategic approach that connects education with real-world work roles.

- **Job Fairs:** Attend job fairs to gain awareness for your company and meet students.
- **Post Jobs at Schools**: Some schools also have online platforms where employers can post job openings directly. Others allow flyers posted in a certain location within the school.
- **Internships/Shadow Experiences**: These can provide students with new skills, work experience, and professional contacts
- **Work with Career & Guidance Counselors:** Counselors can provide guidance to students about their professional goals. They can help students understand their options, evaluate challenging professional decisions, and provide resources for securing a great job.. Recruiters can work with these counselors to understand the skills and interests of students, which can help in targeting the right candidates.

LinkedIn



To increase your reach on LinkedIn for <u>free</u>, you can:

- **Optimize Your Profile:** Complete your profile to 100% to receive more reach. This includes having a professional photo, compelling headline, detailed work history, and a well-crafted summary.
- **Engage with Others:** Comment on relevant posts and join LinkedIn groups to network with your ideal candidates.
- **Create Quality Content**: Regularly post valuable content that resonates with your audience.
- **Leverage Your Network:** Encourage your team to engage with your posts. Their interactions can increase your visibility and reach.
- **Use Keywords:** Incorporate industry-related keywords in your profile to improve its visibility in search results.
- **Contribute to Collaborative Articles:** Share your unique perspectives, personal examples, and professional opinions on these articles.
- **Hiring frame:** Tool that recruiters can add to their profile picture to signal that they're hiring
- **Company Page**: dedicated profile for businesses to connect with the LinkedIn community, showcasing their brand, products, services, and career opportunities. Keep it fresh and post updates

Keep in Mind:

- **Don't Send Generic Connection Requests:** Always personalize your connection requests.
- **Don't Spam Connect:** Always visit a person's profile before sending a connection request. This allows you to customize your invitation.
- **Don't Neglect Your Profile:** An incomplete or outdated profile can be a turn-off for potential connections. Make sure your profile is up-to-date and fully filled out.
- **Don't Be Inactive:** Regularly post updates, engage with your connections, and contribute to discussions.

LinkedIn Recruiter

Paid Service

Sourcing Candidates

Filter by candidate requirements like job titles, locations, and skills, with 40+ advanced filters.

LinkedIn Recruiter uses AI to match job requirements with candidate profiles, optimizing search results based on skills, experience, and job interest.

Prioritize Candidate Reach-outs

Instantly identify candidates who want to hear from you using the “Open to work” filter

Increase the likelihood of an InMail response by up to 20% when reaching out to candidates found through these filters

In-Mail

Write highly personalized InMails with one click using AI-assisted messaging.

Save time with customizable InMail templates and bulk-messaging capabilities.

Schedule and send automated follow-ups to stay top of mind.

Boolean Search

Operator	Description	Example
AND	Narrows search to include only results with all required keywords.	"registered nurse" AND "home health
OR	Expands search to include results with any of the defined keywords or phrases.	"caregiver" OR "home health aide" OR "personal care assistant"
NOT	Limits search by excluding defined keywords or phrases from results.	"Certified Nursing Assistant" NOT "medical assistant"
Quotation Marks	Returns results with the exact phrase in the specified order.	"home health RN" *This search will return results that include the exact phrase 'home health RN'*
Parentheses	Gives priority to the keywords within over other elements.	(LPN OR "Licensed Practical Nurse") AND "home health" *This search will return results that include either 'LPN' or 'Licensed Practical Nurse', and also include 'home health'*

Grassroots Recruitment

Grassroots recruitment is a strategy that leverages relationships with local communities and businesses to attract potential candidates. It involves using recruiting collateral in candidate-frequented locations and technology like mobile recruiting. It's also involved employees in recruitment efforts, promoting your organization passively.

Examples:

Rip-Tab Signs
(Coffee shops, Laundry mats, more)

Recruitment Collateral
(Brochures, Flyers, Yard Signs, More)

Local & College Job Fairs

Employee Referral Programs

Community Engagement & Volunteering

Church Communities
(Newsletters, Bulletin Boards, More)

The key to successful grassroots recruiting is building strong relationships within the community

Social Media Recruitment

Facebook, Instagram, LinkedIn, X (Twitter), YouTube TikTok, & More

Organic and Paid Content

Do's:

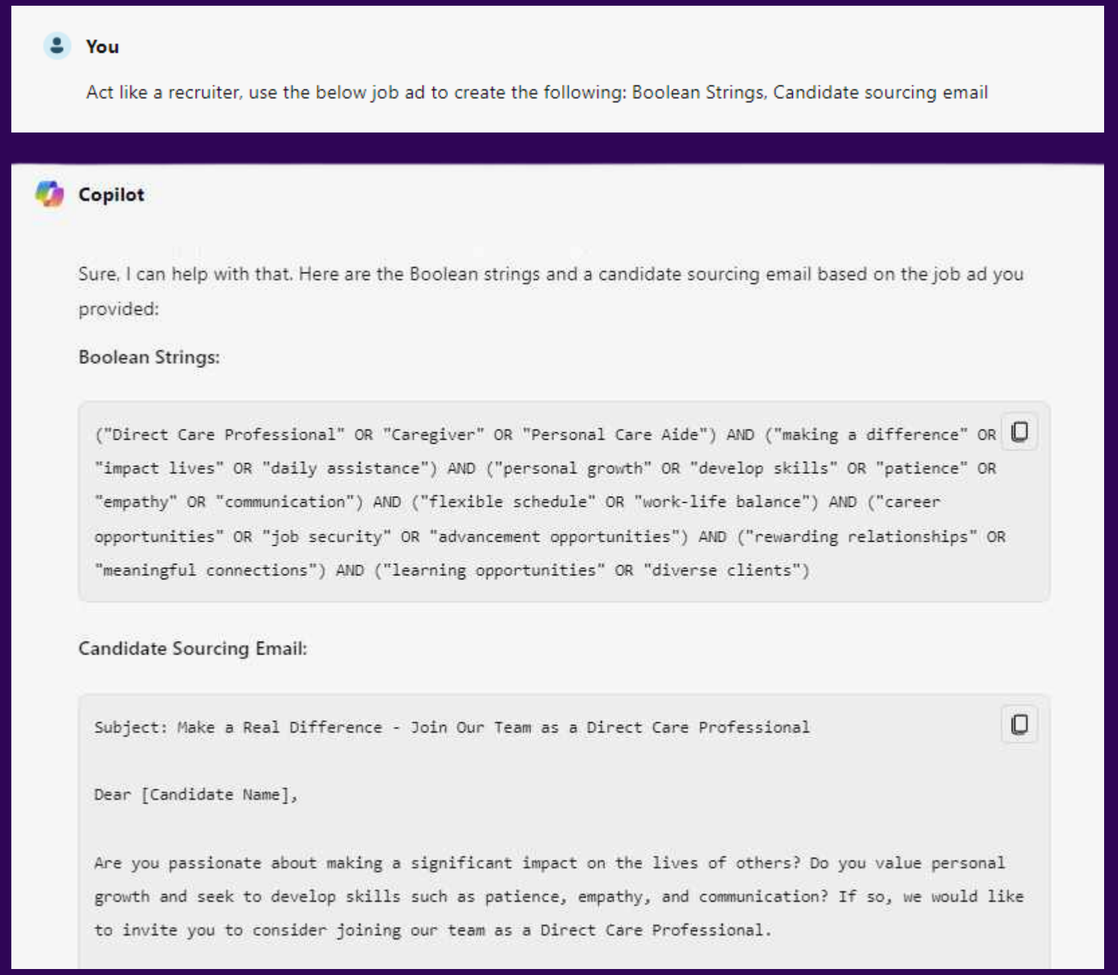
- **Use Different Platforms:** Each social media platform has a unique audience. Select the right channel to connect with target candidates
- **Create a Compelling Recruiter Profile:** Your profile should be impressive and professional. Include information about your tenure at the company and background in the recruiting industry
- **Participate in Groups**: Become active in relevant groups on social media sites like Facebook and LinkedIn.
- **Engage with Candidates:** Respond promptly to inquiries and feedback.
- **Use Advanced Tools:** Some platforms have tools for searching specific certifications or training.

Don'ts:

- **Limit Yourself to One Platform:** Don't restrict yourself to one platform. Different platforms can reach different audiences
- **Ignore Your Online Presence:** Don't neglect your online presence. Your profile should be professional and engaging
- **Be Inactive in Groups:** Don't just join groups, participate actively
- Ignore Candidate Inquiries: Don't ignore inquiries or feedback from candidates
- **Ignore Advanced Tools:** Don't overlook the advanced tools offered by some platforms

Utilizing AI & Automation in Recruitment

- **Scheduling Interviews:** Tools like Microsoft Bookings, Calendly, and Google Calendar can automate the scheduling of interviews. Candidates can self-schedule their preferred interview times, reducing the need for time-consuming email exchanges.
- **Optimize Job Descriptions:** AI can analyze language and keywords to improve search engine optimization (SEO) for job ads. This increases the chances of job postings appearing in relevant searches
- **Remove Biases:** AI helps in removing biases from job ads, promoting diversity and inclusivity in hiring practices.
- **Generate Ad Creatives:** AI can quickly generate a variety of ad creatives, saving time and resources in the design process.
- **Boolean Search Strings:** AI can significantly enhance the effectiveness of Boolean searches in job recruitment. It can help recruiters refine their Boolean queries, making them more accurate and encompassing.
- **Draft Email Generation:** AI can quickly generate draft emails, eliminating those dreaded moments of staring at a blank screen. With AI, you'll find yourself with a draft within seconds, allowing you to focus your energy on perfecting your message rather than starting from scratch. Remember to add personalization & your voice to these messages.



PHA Business Partners

Polsinelli Online Solutions for Home Care (POSH) provides an online, affordable, one-of-a-kind experience for home-based care employers of all sizes. POSH subscribers have access to a comprehensive set of customizable up-to-date forms, tools and resources at the federal, state, and local levels.
